libapache2-mod-perl2-2.0.12::doUserContriblibapache2-mod-perl2-2.0.12::docs::api::APR::String(3pm)

NAME

APR::String - Perl API for manipulating APR UUIDs

Synopsis

```
use APR::String ();  
  
# 42_000 => " 41K",  
  
my $size_str = APR::String::format_size($size);
```

Description

"APR::String" provides strings manipulation API.

API

"APR::String" provides the following functions and/or methods:

"format\_size"

```
my $size_str = APR::String::format_size($size);
```

arg1: \$size ( integer )

ret: \$size\_str

returns a formatted size string representation of a number. The size given in the string will be in units of bytes, kilobytes, or megabytes, depending on the size. The length of that string is always 4 chars long. For example:

```
0          => " 0 ",  
42         => " 42 ",  
42_000     => " 41K",  
42_000_000 => " 40M",
```

since: 2.0.00
