Apache2::SiteControl::GrantAllRule(3pm) Perl DocumApache2::SiteControl::GrantAllRule(3pm)

### NAME

Apache2::SiteControl::GrantAllRule - A rule that grants permission to do everything.

### SYNOPSIS

In your instance of a ManagerFactory:

```
use Apache2::SiteControl::GrantAllRule;
...
sub getPermissionManager
{
    ...
    $manager->addRule(new Apache2::SiteControl::GrantAllRule);
    ...
    return $manager;
}
```

### DESCRIPTION

Apache2::SiteControl::GrantAllRule is a pre-built rule that grants access for all permission requests. This rule can be used to help implement a system that has a default policy of allowing access, and to which you add rules that deny access for specific cases. Note that the loose type checking of Perl makes this inherently dangerous, since a typo is likely to fail to deny access. It is recommended that you take the opposite approach with your rules, since a typo will err on the side of denying access. The former is a security hole, the latter is a bug that people will complain about (so you can fix it).
