NAME

Apache::AuthCookie::Params::CGI - Internal CGI Params Subclass

VERSION

version 3.31

SYNOPSIS

Internal Use Only!

DESCRIPTION

This is a pure perl implementation of HTTP/CGI parameter processing for

Apache::AuthCookie.

METHODS

new(\$r)

Constructor

request(): scalar

Get the apache request object

param()

Get or set parameters. This manipulates the enderlying params() object. When called with

no parameters returns the list of CGI parameter names. Return value depends on the

arguments passed:

? param()

Return the list of CGI parameter names

? param(\$field)

Return the value of the given CGI field. If the field has multiple values they will

all be returned as a list.

? param(\$field, @values)

Set the given CGI field value to the given values. Existing values will be replaced.

=end

params(): Hash::MultiValue

Get the underlying CGI parameters. This is a merged version of query_params() and body_params().

query_params(): Hash::MultiValue

Get the request query parameters.

body_params(): Hash::MultiValue

Get the request body parameters.

content_length(): int

Get the values of the "Content-Length" header. Returns 0 if the header is not present or empty.

content_type(): string

Get the value of the "Content-Type" header. Returns an empty string if the header is not present.
