Apache::Session::Sybase(3pm) User Contributed Perl Documentation Apache::Session::Sybase(3pm)

NAME

Apache::Session::Sybase - An implementation of Apache::Session

SYNOPSIS

```
use Apache::Session::Sybase;
```

```
# if you want Apache::Session to open new DB handles:
```

```
tie %hash, 'Apache::Session::Sybase', $id, {  
    DataSource => 'dbi:Sybase:database=sessions;server=SYBASE',  
    UserName   => $db_user,  
    Password   => $db_pass,  
    Commit     => 1,  
};
```

```
# or, if your handle is already opened:
```

```
tie %hash, 'Apache::Session::Sybase', $id, {  
    Handle     => $dbh,  
    Commit     => 0,  
};
```

## DESCRIPTION

This module is an implementation of `Apache::Session`. It uses the Sybase backing store and the Null locking scheme. See the example, and the documentation for `Apache::Session::Store::Sybase` (also for the parameters that get passed to the backing store along with the schema necessary to save the sessions) and `Apache::Session::Lock::Null` for more details.

## AUTHOR

This module was based on `Apache::Session::MySQL` which was written by Jeffrey William Baker <jwbaker@acm.org>; it was modified by Chris Winters <chris@cwinters.com>.
