Apache::TestHandler(3pm) User Contributed Perl Documentation Apache::TestHandler(3pm)

NAME

Apache::TestHandler - a few response handlers and helpers

SYNOPSIS

```
package My::Test;

use Apache::TestHandler ();

sub handler {
    my ($r) = @_;
    my $result = do_my_test;

    Apache::TestHandler::ok1 $r, $result;
}

sub handler2 {
    my ($r) = @_;
    my $result = do_my_test;

    Apache::TestHandler::ok $r, $result;
}
```

DESCRIPTION

"Apache::TestHandler" provides 2 very simple response handler.

FUNCTIONS

ok \$r, \$boolean

The handler simply prints out "ok" or "not ok" depending on the optional \$boolean parameter.

If \$boolean is omitted "true" is assumed.

ok1 \$r, \$boolean

This handler implements a simple response-only test. It can be used on its own to check if for a certain URI the response phase is reached. Or it can be called like a normal function to print out the test result. The client side is automatically created as described in

<http://perl.apache.org/docs/general/testing/testing.html#Developing_Response_only_Part_of_a_Test>.

\$boolean is optional. If omitted "true" is assumed.
