Dumpvalue(3perl) Perl Programmers Reference Guide Dumpvalue(3perl)

**NAME**

Dumpvalue - provides screen dump of Perl data.

**SYNOPSIS**

```
use Dumpvalue;

my $dumper = Dumpvalue->new;

$dumper->set(globPrint => 1);

$dumper->dumpValue(\*::);

$dumper->dumpvars('main');

my $dump = $dumper->stringify($some_value);
```

**DESCRIPTION**

**Creation**

A new dumper is created by a call

```
$d = Dumpvalue->new(option1 => value1, option2 => value2)
```

Recognized options:

"arrayDepth", "hashDepth"

Print only first N elements of arrays and hashes. If false, prints all the elements.

"compactDump", "veryCompact"

Change style of array and hash dump. If true, short array may be printed on one line.

"globPrint"

Whether to print contents of globs.

"dumpDBFiles"

Dump arrays holding contents of debugged files.

"dumpPackages"

Dump symbol tables of packages.

"dumpReused"

Dump contents of "reused" addresses.

"tick", "quoteHighBit", "printUndef"

Change style of string dump. Default value of "tick" is "auto", one can enable either double-quotish dump, or single-quotish by setting it to "" or """. By default, characters with high bit set are printed as is. If "quoteHighBit" is set, they will be quoted.

"usageOnly"

rudimentary per-package memory usage dump. If set, "dumpvars" calculates total size of strings in variables in the package.

unctrl

Changes the style of printout of strings. Possible values are "unctrl" and "quote".

subdump

Whether to try to find the subroutine name given the reference.

bareStringify

Whether to write the non-overloaded form of the stringify-overloaded objects.

#### quoteHighBit

Whether to print chars with high bit set in binary or "as is".

#### stopDbSignal

Whether to abort printing if debugger signal flag is raised.

Later in the life of the object the methods may be queried with get() method and set() method (which accept multiple arguments).

### Methods

#### dumpValue

```
$dumper->dumpValue($value);  
$dumper->dumpValue([$value1, $value2]);
```

Prints a dump to the currently selected filehandle.

#### dumpValues

```
$dumper->dumpValues($value1, $value2);
```

Same as "\$dumper->dumpValue([\$value1, \$value2]);".

#### stringify

```
my $dump = $dumper->stringify($value [,$noticks] );
```

Returns the dump of a single scalar without printing. If the second argument is true, the return value does not contain enclosing ticks. Does not handle data structures.

#### dumpvars

```
$dumper->dumpvars('my_package');  
$dumper->dumpvars('my_package', 'foo', '~bar$', '!.....');
```

The optional arguments are considered as literal strings unless they start with "~" or "!", in which case they are interpreted as regular expressions (possibly negated).

The second example prints entries with names "foo", and also entries with names which ends on "bar", or are shorter than 5 chars.

set\_quote

```
$d->set_quote("");
```

Sets "tick" and "unctrl" options to suitable values for printout with the given quote char. Possible values are "auto", "" and """.

set\_unctrl

```
$d->set_unctrl('unctrl');
```

Sets "unctrl" option with checking for an invalid argument. Possible values are "unctrl" and "quote".

compactDump

```
$d->compactDump(1);
```

Sets "compactDump" option. If the value is 1, sets to a reasonable big number.

veryCompact

```
$d->veryCompact(1);
```

Sets "compactDump" and "veryCompact" options simultaneously.

set

```
$d->set(option1 => value1, option2 => value2);
```

get

```
@values = $d->get('option1', 'option2');
```
