Net::DNS::RR::TKEY(3pm) User Contributed Perl Documentation Net::DNS::RR::TKEY(3pm)

### NAME

Net::DNS::RR::TKEY - DNS TKEY resource record

### SYNOPSIS

use Net::DNS;

### DESCRIPTION

Class for DNS TSIG Key (TKEY) resource records.

### METHODS

The available methods are those inherited from the base class augmented by the type-specific methods defined in this package.

Use of undocumented package features or direct access to internal data structures is discouraged and could result in program termination or other unpredictable behaviour.

#### algorithm

```
$algorithm = $rr->algorithm;
```

```
$rr->algorithm( $algorithm );
```

The algorithm name is in the form of a domain name with the same meaning as in [RFC 2845]. The algorithm determines how the secret keying material agreed to using the TKEY RR is actually used to derive the algorithm specific key.

#### inception

```
$inception = $rr->inception;
```

```
$rr->inception( $inception );
```

Time expressed as the number of non-leap seconds modulo  $2^{32}$  since the beginning of January 1970 GMT.

#### expiration

```
$expiration = $rr->expiration;
```

```
$rr->expiration( $expiration );
```

Time expressed as the number of non-leap seconds modulo  $2^{32}$  since the beginning of January 1970 GMT.

#### mode

```
$mode = $rr->mode;
```

```
$rr->mode( $mode );
```

The mode field specifies the general scheme for key agreement or the purpose of the TKEY DNS message, as defined in [RFC2930(2.5)].

#### error

```
$error = $rr->error;
```

```
$rr->error( $error );
```

The error code field is an extended RCODE.

#### key

```
$key = $rr->key;
```

```
$rr->key( $key );
```

Sequence of octets representing the key exchange data. The meaning of this data depends on the mode.

#### other

```
$other = $rr->other;
```

```
$rr->other( $other );
```

Content not defined in the [RFC2930] specification but may be used in future extensions.
