Package::Stash::PP(3pm) User Contributed Perl Documentation Package::Stash::PP(3pm)

NAME

Package::Stash::PP - Pure perl implementation of the Package::Stash API

VERSION

version 0.39

SYNOPSIS

```
use Package::Stash;
```

DESCRIPTION

This is a backend for Package::Stash implemented in pure perl, for those without a compiler or who would like to use this inline in scripts.

? `remove_symbol` also replaces the associated typeglob

This can cause unexpected behavior when doing manipulation at compile time - removing subroutines will still allow them to be called from within the package as subroutines (although they will not be available as methods). This can be considered a feature in some cases (this is how `namespace::clean` works, for instance), but should not be relied upon - use `"remove_glob"` directly if you want this behavior.

? Some minor memory leaks

The pure perl implementation has a couple minor memory leaks (see the TODO tests in `t/20-leaks.t`) that I'm having a hard time tracking down - these may be core perl bugs, it's hard to tell.
