Pod::Simple::LinkSection(3perl) Perl Programmers Reference Guide Pod::Simple::LinkSection(3perl)

NAME

Pod::Simple::LinkSection -- represent "section" attributes of L codes

SYNOPSIS

a long story

DESCRIPTION

This class is not of interest to general users.

Pod::Simple uses this class for representing the value of the "section" attribute of "L" start-element events. Most applications can just use the normal stringification of objects of this class; they stringify to just the text content of the section, such as "foo" for "L<Stuff/foo>", and "bar" for "L<Stuff/bl<ar>>".

However, anyone particularly interested in getting the full value of the treelet, can just traverse the content of the treelet @\$treelet_object. To wit:

```
% perl -MData::Dumper -e
"use base qw(Pod::Simple::Methody);
sub start_L { print Dumper($_[1]{'section'}) }
__PACKAGE__->new->parse_string_document('=head1 L<Foo/bl<ar>baz>>')
"
```

Output:

```
$VAR1 = bless( [
    ",
    {},
    'b',
```

```

    bless( [
        'l',
        {},
        'ar'
    ], 'Pod::Simple::LinkSection' ),
    'baz'
], 'Pod::Simple::LinkSection' );

```

But stringify it and you get just the text content:

```

% perl -MData::Dumper -e
"use base qw(Pod::Simple::Methody);
sub start_L { print Dumper( " . $_[1]{'section'} ) }
__PACKAGE__->new->parse_string_document('=head1 L<Foo/bl<ar>baz>>')
"

```

Output:

```
$VAR1 = 'barbaz';
```
