Parser::Style::Objects(3pm) User Contributed Perl Documentation Parser::Style::Objects(3pm)

NAME

XML::Parser::Style::Objects - Objects styler parser

SYNOPSIS

```
use XML::Parser;

my $p = XML::Parser->new(Style => 'Objects', Pkg => 'MyNode');

my $tree = $p->parsefile('foo.xml');
```

DESCRIPTION

This module implements XML::Parser's Objects style parser.

This is similar to the Tree style, except that a hash object is created for each element.

The corresponding object will be in the class whose name is created by appending "::" and the element name to the package set with the Pkg option. Non-markup text will be in the ::Characters class. The contents of the corresponding object will be in an anonymous array that is the value of the Kids property for that object.
