autodie::Scope::Guard(3perl) Perl Programmers Reference Guide autodie::Scope::Guard(3perl)

NAME

autodie::Scope::Guard - Wrapper class for calling subs at end of scope

SYNOPSIS

```
use autodie::Scope::Guard;

$^H{'my-key'} = autodie::Scope::Guard->new(sub {
    print "Hallo world\n";
});
```

DESCRIPTION

This class is used to bless perl subs so that they are invoked when they are destroyed.

This is mostly useful for ensuring the code is invoked at end of scope. This module is not a part of autodie's public API.

This module is directly inspired by chocolateboy's excellent Scope::Guard module.

Methods

new

```
my $hook = autodie::Scope::Guard->new(sub {});
```

Creates a new "autodie::Scope::Guard", which will invoke the given sub once it goes out of scope (i.e. its DESTROY handler is called).
