**\$ man cacoshl.3**

CACOSH(3)                      Linux Programmer's Manual                      CACOSH(3)

**NAME**

      cacosh, cacoshf, cacoshl - complex arc hyperbolic cosine

**SYNOPSIS**

```
#include <complex.h>

double complex cacosh(double complex z);

float complex cacoshf(float complex z);

long double complex cacoshl(long double complex z);

Link with -lm.
```

**DESCRIPTION**

      These functions calculate the complex arc hyperbolic cosine of z. If  $y = \text{cacosh}(z)$ , then  $z = \text{ccosh}(y)$ . The imaginary part of y is chosen in the interval  $[-\pi, \pi]$ . The real part of y is chosen nonnegative.

      One has:

$$\text{cacosh}(z) = 2 * \log(\text{csqrt}((z + 1) / 2) + \text{csqrt}((z - 1) / 2))$$

**VERSIONS**

      These functions first appeared in glibc in version 2.1.

**ATTRIBUTES**

      For an explanation of the terms used in this section, see attributes(7).

## CONFORMING TO

C99, POSIX.1-2001, POSIX.1-2008.

## EXAMPLES

```
/* Link with "-lm" */

#include <complex.h>
#include <stdlib.h>
#include <unistd.h>
#include <stdio.h>

int
main(int argc, char *argv[])
{
    double complex z, c, f;

    if (argc != 3) {
        fprintf(stderr, "Usage: %s <real> <imag>\n", argv[0]);
        exit(EXIT_FAILURE);
    }

    z = atof(argv[1]) + atof(argv[2]) * I;
    c = cacosh(z);

    printf("cacosh() = %6.3f %6.3f*i\n", creal(c), cimag(c));

    f = 2 * clog(csqrt((z + 1)/2) + csqrt((z - 1)/2));

    printf("formula = %6.3f %6.3f*i\n", creal(f2), cimag(f2));

    exit(EXIT_SUCCESS);
}
```
