Rocky Enterprise Linux 9.2 Manual Pages on command 'debconf-escape.1'

$ man debconf-escape.1

DEBCONF-ESCAPE(1)   Debconf   DEBCONF-ESCAPE(1)

NAME

    debconf-escape - helper when working with debconf's escape capability

SYNOPSIS

    debconf-escape -e < unescaped-text

    debconf-escape -u < escaped-text

DESCRIPTION

    When debconf has the 'escape' capability set, it will expect commands you send it to have

    backslashes and newlines escaped (as "\\" and "\n" respectively) and will in turn escape

    backslashes and newlines in its replies. This can be used, for example, to substitute

    multi-line strings into templates, or to get multi-line extended descriptions reliably

    using "METAGET".

SEE ALSO

    debconf-devel(7) (available in the debconf-doc package)
