Rocky Enterprise Linux 9.2 Manual Pages on command 'mkfs.bfs.8'

$ man mkfs.bfs.8

MKFS.BFS(8)   System Administration   MKFS.BFS(8)

NAME

    mkfs.bfs - make an SCO bfs filesystem

SYNOPSIS

    mkfs.bfs [options] device [block-count]

DESCRIPTION

    mkfs.bfs creates an SCO bfs filesystem on a block device (usually a disk partition or a

    file accessed via the loop device).

    The block-count parameter is the desired size of the filesystem, in blocks. If nothing is

    specified, the entire partition will be used.

OPTIONS

    -N, --inodes number

        Specify the desired number of inodes (at most 512). If nothing is specified, some

        default number in the range 48-512 is picked depending on the size of the partition.

    -V, --vname label

        Specify the volume label. I have no idea if/where this is used.

    -F, --fname name

        Specify the filesystem name. I have no idea if/where this is used.

    -v, --verbose

        Explain what is being done.

    -c

        This option is silently ignored.

    -l

This option is silently ignored.

-h, --help

Display help text and exit.

-V, --version

Display version information and exit. Option -V only works as --version when it is the

only option.

EXIT STATUS

The exit status returned by mkfs.bfs is 0 when all went well, and 1 when something went

wrong.
