Rocky Enterprise Linux 9.2 Manual Pages on command 'podman-machine-start.1'

$ man podman-machine-start.1

podman-machine-start(1)()   podman-machine-start(1)()

NAME

   podman-machine-start - Start a virtual machine

SYNOPSIS

   podman machine start [name]

DESCRIPTION

   Starts a virtual machine for Podman.

   Podman on macOS requires a virtual machine. This is because containers are Linux - con?

   tainers do not run on any other OS because containers' core functionality are tied to the

   Linux kernel.

   Only one Podman managed VM can be active at a time. If a VM is already running, podman ma?

   chine start will return an error.

   podman machine start starts a Linux virtual machine where containers are run.

OPTIONS

  --help

   Print usage statement.

EXAMPLES

        $ podman machine start myvm
