Rocky Enterprise Linux 9.2 Manual Pages on command 'readdir.3am'

\$ man readdir.3am

REaddir(3am) GNU Awk Extension Modules REaddir(3am)

NAME

readdir - directory input parser for gawk

SYNOPSIS

@load "readdir"

DESCRIPTION

The readdir extension adds an input parser for directories.

When this extension is in use, instead of skipping directories named on the command line (or with getline), they are read, with each entry returned as a record.

The record consists of three fields. The first two are the inode number and the filename, separated by a forward slash character. On systems where the directory entry contains the file type, the record has a third field which is a single letter indicating the type of the file: f for file, d for directory, b for a block device, c for a character device, p for a FIFO, l for a symbolic link, s for a socket.

On systems without the file type information, the extension falls back to calling stat(2), in order to provide the information. Thus the third field should never be u.

By default, if a directory cannot be opened (due to permission problems, for example), gawk will exit. As with regular files, this situation can be handled using a BEGINFILE rule that checks ERRNO and prints an error or otherwise handles the problem.

EXAMPLE

```
@load "readdir"
...
BEGIN { FS = "/" }
```

```
{ print "file name is", $2 }
```
