XtAppSetFallbackResources(3) XT FUNCTIONS XtAppSetFallbackResources(3)

NAME

XtAppSetFallbackResources - set fallback resources

SYNTAX

```
void XtAppSetFallbackResources(XtAppContext app_context, String* specifica?
    tion_list);
```

ARGUMENTS

app_context

Specifies the application context.

specification_list

Specifies a NULL-terminated list of resource specifications to pre-load the database, or NULL.

DESCRIPTION

Each entry in specification_list points to a string in the format XrmPutLineRe? source. following a call to XtAppSetFallbackResources, when a resource database is being created for a particular screen and the Intrinsics are not able to find or read an application-specific class resource file and if specification_list is not

NULL the resource specification in `specification_list` will be merged into the screen resource database in place of the application-specific class resource file. `XtAppSetFallbackResources` is not required to copy `specification_list`; the caller must ensure that the contents of the list and the strings addressed by the list remain valid until all displays are initialized or until `XtAppSetFallbackResources` is called again. The value NULL for `specification_list` removes any previous fallback resource specification for the application context. The intended use for fallback resources is to provide a minimal number of resources that will make the application usable (or at least terminate with helpful diagnostic messages) when some problem exists in finding and loading the application defaults file.
