GETPROTOENT_R(3) Linux Programmer's Manual GETPROTOENT_R(3)

NAME

getprotoent_r, getprotobyname_r, getprotobyname_r - get protocol entry (reen?
trant)

SYNOPSIS

```
#include <netdb.h>
```

```
int getprotoent_r(struct protoent *result_buf, char *buf,  
                 size_t buflen, struct protoent **result);
```

```
int getprotobyname_r(const char *name,  
                    struct protoent *result_buf, char *buf,  
                    size_t buflen, struct protoent **result);
```

```
int getprotobyname_r(int proto,  
                    struct protoent *result_buf, char *buf,  
                    size_t buflen, struct protoent **result);
```

Feature Test Macro Requirements for glibc (see feature_test_macros(7)):

getprotoent_r(), getprotobyname_r(), getprotobyname_r():

Since glibc 2.19:

```
  _DEFAULT_SOURCE
```

Glibc 2.19 and earlier:

```
  _BSD_SOURCE || _SVID_SOURCE
```

DESCRIPTION

The getprotoent_r(), getprotobyname_r(), and getprotobyname_r() functions are the

reentrant equivalents of, respectively, `getprotoent(3)`, `getprotobyname(3)`, and `getprotobynumber(3)`. They differ in the way that the `protoent` structure is returned, and in the function calling signature and return value. This manual page describes just the differences from the nonreentrant functions.

Instead of returning a pointer to a statically allocated `protoent` structure as the function result, these functions copy the structure into the location pointed to by `result_buf`.

The `buf` array is used to store the string fields pointed to by the returned `protoent` structure. (The nonreentrant functions allocate these strings in static storage.) The size of this array is specified in `buflen`. If `buf` is too small, the call fails with the error `ERANGE`, and the caller must try again with a larger `buf`. (A buffer of length 1024 bytes should be sufficient for most applications.)

If the function call successfully obtains a protocol record, then `*result` is set pointing to `result_buf`; otherwise, `*result` is set to `NULL`.

RETURN VALUE

On success, these functions return 0. On error, they return one of the positive error numbers listed in `ERRORS`.

On error, record not found (`getprotobyname_r()`, `getprotobynumber_r()`), or end of input (`getprotoent_r()`) result is set to `NULL`.

ERRORS

`ENOENT` (`getprotoent_r()`) No more records in database.

`ERANGE` `buf` is too small. Try again with a larger buffer (and increased `buflen`).

ATTRIBUTES

For an explanation of the terms used in this section, see `attributes(7)`.

??

Interface	Attribute	Value	
-----------	-----------	-------	--

??

<code>getprotoent_r()</code>	Thread safety	MT-Safe locale	
------------------------------	---------------	----------------	--

<code>getprotobyname_r()</code>			
---------------------------------	--	--	--

<code>getprotobynumber_r()</code>			
-----------------------------------	--	--	--

??

CONFORMING TO

These functions are GNU extensions. Functions with similar names exist on some

other systems, though typically with different calling signatures.

EXAMPLE

The program below uses `getprotobyname_r()` to retrieve the protocol record for the protocol named in its first command-line argument. If a second (integer) command-line argument is supplied, it is used as the initial value for `buflen`; if `getprotobyname_r()` fails with the error `ERANGE`, the program retries with larger buffer sizes. The following shell session shows a couple of sample runs:

```
$ ./a.out tcp 1
ERANGE! Retrying with larger buffer
getprotobyname_r() returned: 0 (success) (buflen=78)
p_name=tcp; p_proto=6; aliases=TCP
$ ./a.out xxx 1
ERANGE! Retrying with larger buffer
getprotobyname_r() returned: 0 (success) (buflen=100)
Call failed/record not found
```

Program source

```
#define _GNU_SOURCE
#include <ctype.h>
#include <netdb.h>
#include <stdlib.h>
#include <stdio.h>
#include <errno.h>
#include <string.h>
#define MAX_BUF 10000
int
main(int argc, char *argv[])
{
    int buflen, erange_cnt, s;
    struct protoent result_buf;
    struct protoent *result;
    char buf[MAX_BUF];
    char **p;
    if (argc < 2) {
```

```

printf("Usage: %s proto-name [buflen]\n", argv[0]);
exit(EXIT_FAILURE);
}
buflen = 1024;
if (argc > 2)
    buflen = atoi(argv[2]);
if (buflen > MAX_BUF) {
    printf("Exceeded buffer limit (%d)\n", MAX_BUF);
    exit(EXIT_FAILURE);
}
erange_cnt = 0;
do {
    s = getprotobyname_r(argv[1], &result_buf,
        buf, buflen, &result);
    if (s == ERANGE) {
        if (erange_cnt == 0)
            printf("ERANGE! Retrying with larger buffer\n");
        erange_cnt++;
        /* Increment a byte at a time so we can see exactly
           what size buffer was required */
        buflen++;
        if (buflen > MAX_BUF) {
            printf("Exceeded buffer limit (%d)\n", MAX_BUF);
            exit(EXIT_FAILURE);
        }
    }
} while (s == ERANGE);
printf("getprotobyname_r() returned: %s (buflen=%d)\n",
    (s == 0) ? "0 (success)" : (s == ENOENT) ? "ENOENT" :
    strerror(s), buflen);
if (s != 0 || result == NULL) {
    printf("Call failed/record not found\n");
    exit(EXIT_FAILURE);
}

```

```
}  
printf("p_name=%s; p_proto=%d; aliases=",  
      result_buf.p_name, result_buf.p_proto);  
for (p = result_buf.p_aliases; *p != NULL; p++)  
    printf("%s ", *p);  
printf("\n");  
exit(EXIT_SUCCESS);  
}
```
