

## **Rocky Enterprise Linux 9.2 Manual Pages on command 'git-credential-cache--daemon.1'**

**C:\>man git-credential-cache--daemon.1**

GIT-CREDENTIAL-CAC(1)                      Git Manual                      GIT-CREDENTIAL-CAC(1)

### NAME

git-credential-cache--daemon - Temporarily store user credentials in memory

### SYNOPSIS

git credential-cache?daemon [--debug] <socket>

### DESCRIPTION

#### Note

You probably don't want to invoke this command yourself; it is started automatically when you use git-credential-cache(1).

This command listens on the Unix domain socket specified by <socket> for git-credential-cache clients. Clients may store and retrieve credentials. Each credential is held for a timeout specified by the client; once no credentials are held, the daemon exits.

If the --debug option is specified, the daemon does not close its stderr stream, and may output extra diagnostics to it even after it has begun listening for clients.

### GIT

Part of the git(1) suite

Git 2.25.1                      02/08/2023                      GIT-CREDENTIAL-CAC(1)
