C:\>man loadunimap.8

LOADUNIMAP(8) System Manager's Manual LOADUNIMAP(8)

NAME

loadunimap - load the kernel unicode-to-font mapping table

SYNOPSIS

loadunimap [-C console] [-o oldmap] [map]

DESCRIPTION

The loadunimap command is obsolete - its function is now built-in into setfont.

However, for backwards compatibility it is still available as a separate command.

The program loadunimap loads the specified map in the kernel unicode-to-font mapping table. If no map is given def is assumed. The default extension (that can be omitted) is .uni.

If the -o oldmap option is given, the old map is saved in the file specified.

On Linux 2.6.1 and later one can specify the console device using the -C option.

Usually one does not call loadunimap directly - its function is also built into setfont.

FILES

/usr/share/unimaps is the default directory for unicode mappings.
