

Rocky Enterprise Linux 9.2 Manual Pages on command 'lsb_release.1'

C:\>man lsb_release.1

lsb_release(1) General Commands Manual lsb_release(1)

NAME

lsb_release - print distribution-specific information

SYNOPSIS

lsb_release [options]

DESCRIPTION

The `lsb_release` command provides certain LSB (Linux Standard Base) and distribution-specific information.

If no options are given, the `-v` option is assumed.

OPTIONS

The program follows the usual GNU command line syntax, with long options starting with two dashes ('--'). A summary of options are included below.

`-v, --version`

Show the version of the LSB against which your current installation is compliant. The version is expressed as a colon separated list of LSB module descriptions.

`-i, --id`

Display the distributor's ID.

`-d, --description`

Display a description of the currently installed distribution.

`-r, --release`

Display the release number of the currently installed distribution.

-c, --codename

Display the code name of the currently installed distribution.

-a, --all

Display all of the above information.

-s, --short

Use the short output format for any information displayed. This format omits the leading header(s).

-h, --help

Show summary of options.

NOTES

This is a reimplementaion of the `lsb_release` command provided by the Free Standards Group. Any bugs are solely the responsibility of the author below.

Detection of systems using a mix of packages from various distributions or releases is something of a black art; the current heuristic tends to assume that the installation is of the earliest distribution which is still being used by apt but that heuristic is subject to error.
