

Rocky Enterprise Linux 9.2 Manual Pages on command 'lsinitramfs.8'

C:\>man lsinitramfs.8

LSINITRAMFS(8) System Administration LSINITRAMFS(8)

NAME

lsinitramfs - list content of an initramfs image

SYNOPSIS

lsinitramfs [-l] initramfs-file...

lsinitramfs -h

DESCRIPTION

The lsinitramfs command lists the content of given initramfs images. It allows one to quickly check the content of one (or multiple) specified initramfs files.

OPTIONS

- h Display usage information and exit.
- l Display long and more verbose listing of initramfs content.

USAGE EXAMPLES

List initramfs content of current running kernel:

```
lsinitramfs /boot/initrd.img-$(uname -r)
```

List content of two initramfs files in verbose mode:

```
lsinitramfs -l /boot/vmlinuz-2.6.31-grml64 /boot/vmlinuz-2.6.33-grml64
```

BUGS

lsinitramfs cannot deal with multiple-segmented initramfs images, except where an early (uncompressed) initramfs with system firmware is prepended to the regular compressed initramfs.

AUTHOR

The initramfs-tools are written by Maximilian Attems <maks@debian.org> and numerous others.
