Rocky Enterprise Linux 9.2 Manual Pages on command 'openssl-gendsa.1ssl'

C:\>man openssl-gendsa.1ssl

GENDSA(1SSL) OpenSSL GENDSA(1SSL)

NAME

openssl-gendsa, gendsa - generate a DSA private key from a set of parameters

SYNOPSIS

openssl gendsa [-help] [-out filename] [-aes128] [-aes192] [-aes256] [-aria128]

[-aria192] [-aria256] [-camellia128] [-camellia192] [-camellia256] [-des] [-des3]

[-idea] [-rand file...] [-writerand file] [-engine id] [paramfile]

DESCRIPTION

The gendsa command generates a DSA private key from a DSA parameter file (which

will be typically generated by the openssl dsaparam command).

OPTIONS

-help

Print out a usage message.

-out filename

Output the key to the specified file. If this argument is not specified then

standard output is used.

-aes128, -aes192, -aes256, -aria128, -aria192, -aria256, -camellia128,

-camellia192, -camellia256, -des, -des3, -idea

These options encrypt the private key with specified cipher before outputting

it. A pass phrase is prompted for. If none of these options is specified no

encryption is used.

-rand file...

A file or files containing random data used to seed the random number generator. Multiple files can be specified separated by an OS-dependent character. The separator is ; for MS-Windows, , for OpenVMS, and : for all others.

[-writerand file]

Writes random data to the specified file upon exit. This can be used with a subsequent -rand flag.

-engine id

Specifying an engine (by its unique id string) will cause gendsa to attempt to obtain a functional reference to the specified engine, thus initialising it if needed. The engine will then be set as the default for all available algorithms.

paramfile

This option specifies the DSA parameter file to use. The parameters in this file determine the size of the private key. DSA parameters can be generated and examined using the openssl dsaparam command.

NOTES

DSA key generation is little more than random number generation so it is much quicker that RSA key generation for example.
