**C:\>man pam\_getenv.8**

PAM\_GETENV(8)            User Contributed Perl Documentation            PAM\_GETENV(8)

### NAME

pam\_getenv - get environment variables from /etc/environment

### SYNOPSIS

pam\_getenv [-l] [-s] env\_var

### DESCRIPTION

This tool will print out the value of env\_var from /etc/environment. It will attempt to expand environment variable references in the definition of env\_var but will fail if PAM items are expanded.

The -l option indicates the script should return an environment variable related to default locale information.

The -s option indicates that the script should return an system default environment variable.

Currently neither the -l or -s options do anything. They are included because future versions of Debian may have a separate repository for the initial environment used by init scripts and for system locale information. These options

will allow this script to be a stable interface even in that environment.

Debian GNU/Linux
