C:\>man scalbl.3

SCALB(3) Linux Programmer's Manual SCALB(3)

NAME

scalb, scalbf, scalbl - multiply floating-point number by integral power of radix
(OBSOLETE)

SYNOPSIS

```
#include <math.h>

double scalb(double x, double exp);

float scalbf(float x, float exp);

long double scalbl(long double x, long double exp);

Link with -lm.
```

Feature Test Macro Requirements for glibc (see `feature_test_macros(7)`):

```
scalb():

  _XOPEN_SOURCE >= 500

  || /* Since glibc 2.19: */ _DEFAULT_SOURCE

  || /* Glibc versions <= 2.19: */ _BSD_SOURCE || _SVID_SOURCE

scalbf(), scalbl():

  _XOPEN_SOURCE >= 600

  || /* Since glibc 2.19: */ _DEFAULT_SOURCE

  || /* Glibc versions <= 2.19: */ _BSD_SOURCE || _SVID_SOURCE
```

DESCRIPTION

These functions multiply their first argument `x` by `FLT_RADIX` (probably 2) to the power of `exp`, that is:

$x * FLT_RADIX ** exp$

The definition of FLT_RADIX can be obtained by including <float.h>.

RETURN VALUE

On success, these functions return $x * FLT_RADIX ** exp$.

If x or exp is a NaN, a NaN is returned.

If x is positive infinity (negative infinity), and exp is not negative infinity, positive infinity (negative infinity) is returned.

If x is +0 (-0), and exp is not positive infinity, +0 (-0) is returned.

If x is zero, and exp is positive infinity, a domain error occurs, and a NaN is returned.

If x is an infinity, and exp is negative infinity, a domain error occurs, and a NaN is returned.

If the result overflows, a range error occurs, and the functions return HUGE_VAL, HUGE_VALF, or HUGE_VALL, respectively, with a sign the same as x.

If the result underflows, a range error occurs, and the functions return zero, with a sign the same as x.

ERRORS

See math_error(7) for information on how to determine whether an error has occurred when calling these functions.

The following errors can occur:

Domain error: x is 0, and exp is positive infinity, or x is positive infinity and exp is negative infinity and the other argument is not a NaN

An invalid floating-point exception (FE_INVALID) is raised.

Range error, overflow

An overflow floating-point exception (FE_OVERFLOW) is raised.

Range error, underflow

An underflow floating-point exception (FE_UNDERFLOW) is raised.

These functions do not set errno.

ATTRIBUTES

For an explanation of the terms used in this section, see attributes(7).

CONFORMING TO

scalb() is specified in POSIX.1-2001, but marked obsolescent. POSIX.1-2008 removes the specification of scalb(), recommending the use of scalbln(3), scalblnf(3), or scalblnl(3) instead. The scalb() function is from 4.3BSD.

scalbf() and scalbl() are unstandardized; scalbf() is nevertheless present on several other systems
