session-migration(1) Linux User's Manual session-migration(1)

NAME

session-migration - Migrate in user session settings.

SYNOPSIS

session-migration [options]

DESCRIPTION

The `session-migration` program can be used to migrate in-session user data when a program is evolving its configuration, or needing to have files moved and so on.

This program is generally autostarted at the very beginning of the session and integrates caching capabilities.

The general usage is to ship an executable file in `XDG_DATA_DIR/session-migration/scripts`. This one will be executed the next time the user log into the session. It will execute all executable files there in ASCII order, one after another.

Even if the program tries to cache some timestamp and scripts to not be launched twice (they are skipped on subsequent runs), the executables file should be identical.

OPTIONS

`--dry-run`

This parameter enables to run the `session-migration` tool without really launching the scripts and marking them as migrated. It's generally used with `--verbose` for debugging purposes.

--file filename

This parameter, followed by a path or filename, tells sessions-migration to only consider that script file and ignoring XDG_DATA_DIR. It won't log as well this special file as being migrated.

--help Display a quick command help.

--verbose

Show a lot of verbose information. It can be used by the user to debug configuration issues;
