**C:\>man siginterrupt.3**

SIGINTERRUPT(3)                   Linux Programmer's Manual                   SIGINTERRUPT(3)

### NAME

siginterrupt - allow signals to interrupt system calls

### SYNOPSIS

```
#include <signal.h>
```

```
int siginterrupt(int sig, int flag);
```

Feature Test Macro Requirements for glibc (see `feature_test_macros(7)`):

```
siginterrupt():
```

```
  _XOPEN_SOURCE >= 500
```

```
  || /* Since glibc 2.12: */ _POSIX_C_SOURCE >= 200809L
```

```
  || /* Glibc versions <= 2.19: */ _BSD_SOURCE
```

### DESCRIPTION

The `siginterrupt()` function changes the restart behavior when a system call is interrupted by the signal `sig`. If the `flag` argument is false (0), then system calls will be restarted if interrupted by the specified signal `sig`. This is the default behavior in Linux.

If the `flag` argument is true (1) and no data has been transferred, then a system call interrupted by the signal `sig` will return -1 and `errno` will be set to `EINTR`.

If the `flag` argument is true (1) and data transfer has started, then the system call will be interrupted and will return the actual amount of data transferred.

### RETURN VALUE

The `siginterrupt()` function returns 0 on success. It returns -1 if the signal num?

ber sig is invalid, with errno set to indicate the cause of the error.

## ERRORS

EINVAL The specified signal number is invalid.

## ATTRIBUTES

For an explanation of the terms used in this section, see attributes(7).

?siginterrupt() ? Thread safety ? MT-Unsafe const:signr ?

??

## CONFORMING TO

4.3BSD, POSIX.1-2001. POSIX.1-2008 marks siginterrupt() as obsolete, recommending the use of sigaction(2) with the SA\_RESTART flag instead.
