TTYTYPE(5) Linux Programmer's Manual TTYTYPE(5)

NAME

 ttytype - terminal device to default terminal type mapping

DESCRIPTION

 The `/etc/ttytype` file associates `termcap(5)`/`terminfo(5)` terminal type names with tty lines. Each line consists of a terminal type, followed by whitespace, followed by a tty name (a device name without the `/dev/` prefix).

 This association is used by the program `tset(1)` to set the environment variable `TERM` to the default terminal name for the user's current tty.

 This facility was designed for a traditional time-sharing environment featuring character-cell terminals hardwired to a UNIX minicomputer. It is little used on modern workstation and personal UNIX systems.

FILES

`/etc/ttytype`
 the tty definitions file.

EXAMPLE

 A typical `/etc/ttytype` is:

```
    con80x25 tty1
    vt320 ttys0
```

SEE ALSO

`termcap(5)`, `terminfo(5)`, `agetty(8)`, `mingetty(8)`

COLOPHON

This page is part of release 5.05 of the Linux man-pages project. A description of the project, information about reporting bugs, and the latest version of this page, can be found at <https://www.kernel.org/doc/man-pages/>.
