

Rocky Enterprise Linux 9.2 Manual Pages on command 'xconsole.1'

C:\>man xconsole.1

XCONSOLE(1) General Commands Manual XCONSOLE(1)

NAME

xconsole - monitor system console messages with X

SYNOPSIS

xconsole [-toolkitoption ...] [-file file-name] [-notify] [-stripNonprint] [-dae?
mon] [-verbose] [-exitOnFail]

DESCRIPTION

The xconsole program displays messages which are usually sent to /dev/console.

OPTIONS

Xconsole accepts all of the standard X Toolkit command line options along with the additional options listed below:

-file file-name

To monitor some other device, use this option to specify the device name.

This does not work on regular files as they are always ready to be read from.

-notify -nonotify

When new data are received from the console and the notify option is set, the icon name of the application has " *" appended, so that it is evident even when the application is iconified. -notify is the default.

-daemon This option causes xconsole to place itself in the background, using fork/exit.

-verbose

When set, this option directs xconsole to display an informative message in the first line of the text buffer.

`-exitOnFail`

When set, this option directs xconsole to exit when it is unable to redirect the console output.

`-saveLines count`

When set, xconsole only preserves count lines of message history instead of growing the text buffer without bound (a count of zero - the default - is treated as placing no limit on the history).

X DEFAULTS

This program uses the Athena Text widget, look in the Athena Widget Set documentation for controlling it.

Xconsole otherwise accepts resources of the same names as the command-line options (without the leading dash). "file" is a string type, "saveLines" an integer, and the remaining options are booleans.

WIDGETS

In order to specify resources, it is useful to know the hierarchy of the widgets which compose xconsole. In the notation below, indentation indicates hierarchical structure. The widget class name is given first, followed by the widget instance name.

XConsole xconsole

 XConsole text

ENVIRONMENT

DISPLAY to get the default host and display number.

XENVIRONMENT

to get the name of a resource file that overrides the global resources stored in the RESOURCE_MANAGER property.

FILES

/etc/X11/app-defaults/XConsole

 specifies required resources
