Windows PowerShell Get-Help on Cmdlet 'New-AzBastion'

PS:\>Get-HELP New-AzBastion -Full

WARNING: The names of some imported commands from the module 'Microsoft.Azure.PowerShell.Cmdlets.Network' include unapproved verbs that might make them less discoverable.

To find the commands with unapproved verbs, run the Import-Module command again with the Verbose parameter. For a list of approved verbs, type Get-Verb.

NAME

New-AzBastion

SYNOPSIS

Creates a bastion resource.

SYNTAX

New-AzBastion

[-AsJob]

[-DefaultProfile

<Microsoft.Azure.Commands.Common.Authentication.Abstractions.Core.IAzureContextContainer> [-DisableCopyPaste

<System.Nullable`1[System.Boolean]> [-EnableIpConnect <System.Nullable`1[System.Boolean]> [-EnableKerberos

DESCRIPTION

Creates a bastion resource. This will need a Public Ip Address and a VirtualNetwork. There must be a subnet with name AzureBastionSubnet in this VirtualNetwork. The Public Ip Address must be created with Sku Standard.

PARAMETERS

-AsJob <System.Management.Automation.SwitchParameter>

Run cmdlet in the background

Page 4/17

Required? false
Position? named
Default value False
Accept pipeline input? False
Accept wildcard characters? false

-DefaultProfile <Microsoft.Azure.Commands.Common.Authentication.Abstractions.Core.IAzureContextContainer>

The credentials, account, tenant, and subscription used for communication with Azure.

Required? false
Position? named
Default value None
Accept pipeline input? False
Accept wildcard characters? false

-DisableCopyPaste <System.Nullable`1[System.Boolean]>

Copy and Paste

Required? false
Position? named
Default value False
Accept pipeline input? True (ByValue)
Accept wildcard characters? false

-EnableIpConnect <System.Nullable`1[System.Boolean]>

IP Connect

Required? false
Position? named
Default value False
Accept pipeline input? True (ByValue)
Accept wildcard characters? false

-EnableKerberos <System.Nullable`1[System.Boolean]>

Kerberos

Required? false

Position? named

Default value False

Accept pipeline input? True (ByValue)

Accept wildcard characters? false

-EnableShareableLink <System.Nullable`1[System.Boolean]>

Shareable Link

Required? false

Position? named

Default value False

Accept pipeline input? True (ByValue)

Accept wildcard characters? false

-EnableTunneling <System.Nullable`1[System.Boolean]>

Native Client

Required? false

Position? named

Default value False

Accept pipeline input? True (ByValue)

Accept wildcard characters? false

-Name <System.String>

The bastion resource name.

Required? true

Position? named

Default value None

Accept pipeline input? False

Accept wildcard characters? false

-PublicIpAddress <Microsoft.Azure.Commands.Network.Models.PSPublicIpAddress>

The public IP address object for bastion.

Required? true

Position? named

Default value None

Accept pipeline input? False

Accept wildcard characters? false

-PublicIpAddressId <System.String>

The public Ip address Azure resource Id for bastion.

Required? true

Position? named

Default value None

Accept pipeline input? False

Accept wildcard characters? false

-PublicIpAddressName <System.String>

The public Ip address resource name for bastion.

Required? true

Position? named

Default value None

Accept pipeline input? False

Accept wildcard characters? false

-PublicIpAddressRgName <System.String>

The public Ip address resource group name for bastion.

Required? true

Position? named

Default value None

Accept pipeline input? False

Accept wildcard characters? false

-ResourceGroupName <System.String>

The resource group name where you need to create bastion.

Required? true

Position? named

Default value None

Accept pipeline input? False

Accept wildcard characters? false

-ScaleUnit <System.Nullable`1[System.Int32]>

The Scale Units for BastionHost

Required? false

Position? named

Default value 2

Accept pipeline input? True (ByValue)

Accept wildcard characters? false

-Sku <System.String>

The Bastion Sku Tier

Required? false

Position? named

Default value Basic

Accept pipeline input? True (ByValue)

Accept wildcard characters? false

-Tag <System.Collections.Hashtable>

A hashtable which represents resource tags.

Required? false

Position? named

Default value None

Accept pipeline input? False

Accept wildcard characters? false

-VirtualNetwork <Microsoft.Azure.Commands.Network.Models.PSVirtualNetwork>

The virtual network object for bastion.

Required? true

Position? named

Default value None

Accept pipeline input? False

Accept wildcard characters? false

-VirtualNetworkId <System.String>

The virtual network Azure resource Id for bastion.

Required? true

Position? named

Default value None

Accept pipeline input? False

Accept wildcard characters? false

-VirtualNetworkName <System.String>

The virtual network resource name for bastion.

Required? true

Position? named

Default value None

Accept pipeline input? False

Accept wildcard characters? false

-VirtualNetworkRgName <System.String>

The virtual network resource group name for bastion.

Required? true

Position? named

Default value None

Accept pipeline input? False

Accept wildcard characters? false

-Confirm <System.Management.Automation.SwitchParameter>

Prompts you for confirmation before running the cmdlet.

Required? false

Position? named

Default value False

Accept pipeline input? False

Accept wildcard characters? false

-WhatIf <System.Management.Automation.SwitchParameter>

Shows what would happen if the cmdlet runs. The cmdlet is not run.

Required? false

Position? named

Default value False

Accept pipeline input? False

Accept wildcard characters? false

<CommonParameters>

This cmdlet supports the common parameters: Verbose, Debug,

ErrorAction, ErrorVariable, WarningAction, WarningVariable, OutBuffer, PipelineVariable, and OutVariable. For more information, see about_CommonParameters (<https://go.microsoft.com/fwlink/?LinkID=113216>).

INPUTS

System.String

System.Nullable`1[[System.Int32, System.Private.CoreLib, Version=7.0.0.0, Culture=neutral, PublicKeyToken=7cec85d7bea7798e]]

System.Nullable`1[[System.Boolean, System.Private.CoreLib, Version=7.0.0.0, Culture=neutral, PublicKeyToken=7cec85d7bea7798e]]

OUTPUTS

Microsoft.Azure.Commands.Network.Models.PSBastion

NOTES

----- Example 1 -----

```
$subnetName = "AzureBastionSubnet"  
$subnet = New-AzVirtualNetworkSubnetConfig -Name $subnetName -AddressPrefix 10.0.0.0/24  
$vnet = New-AzVirtualNetwork -Name "TestVnet" -ResourceGroupName "BastionPowershellTest" -Location  
"westeurope" -AddressPrefix 10.0.0.0/16 -Subnet $subnet
```

```

$publicip = New-AzPublicIpAddress -ResourceGroupName "BastionPowershellTest" -Name "Test-Ip" -location
"westeurope" -AllocationMethod Dynamic -Sku Standard

$bastion = New-AzBastion -ResourceGroupName "BastionPowershellTest" -Name "test-Bastion2" -PublicIpAddress
$publicip -VirtualNetwork $vnet
