## Windows PowerShell Get-Help on Cmdlet 'Set-NetFirewallHyperVVMSetting'

PS:\>Get-HELP Set-NetFirewallHyperVVMSetting -Full

NAME

Set-NetFirewallHyperVVMSetting

#### **SYNOPSIS**

Configures Hyper-V firewall per-VM settings on the target computer.

### **SYNTAX**

Set-NetFirewallHyperVVMSetting [-AsJob] [-CimSession < CimSession[]>] [-DefaultInboundAction {NotConfigured | Allow | Block}] [-DefaultOutboundAction {NotConfigured |

Allow | Block}] [-Enabled {False | True | NotConfigured}] [-LoopbackEnabled {False | True | NotConfigured}] [-AllowHostPolicyMerge {False | True | NotConfigured}]

[-Name <String>] [-ThrottleLimit <Int32>] [<CommonParameters>]

### **DESCRIPTION**

The Set-NetFirewallHyperVVMSetting cmdlet configures settings for the Hyper-V firewall per-VM settings on the system.

These settings are applicable to all Hyper-V

firewall ports created by a specific Hyper-V firewall VM creator.

This cmdlet should be used when a Hyper-V VM creator has registered its VM creator ID with the system, when another

Hyper-V setting is already configured for the

specified VM creator ID, or when a Hyper-V firewall port is created with the specified VM creator ID. If none of the above

are true, then the

New-NetFirewallHyperVVMSetting cmdlet should be used.

# **PARAMETERS**

-AsJob [<SwitchParameter>]

Runs the cmdlet as a background job. Use this parameter to run commands that take a long time to complete.

Required? false

Position? named

Default value False

Accept pipeline input? False

Accept wildcard characters? false

-CimSession <CimSession[]>

Runs the cmdlet in a remote session or on a remote computer. Enter a computer name or a session object, such as the output of a New-CimSession

(https://go.microsoft.com/fwlink/p/?LinkId=227967)

or

[Get-CimSession](https://go.microsoft.com/fwlink/p/?LinkId=227966)cmdlet. The default is the current session

on the local computer.

Required? false

Position? named

Default value None

Accept pipeline input? False

Accept wildcard characters? false

Specifies how to filter inbound traffic that does not match any Hyper-V firewall rules.

This setting applies the configuration to all profiles. For configuring at a per-profile granularity, use the `Set-NetFirewallHyperVProfile` cmdlet.

The acceptable values for this parameter are: NotConfigured, Allow, or Block.

- Block: Blocks inbound network traffic that does not match an inbound rule.
- Allow: Allows all inbound network traffic, whether or not it matches an inbound rule.
- NotConfigured: Resets this value back to its default.

The default setting is Block.

Required? false

Position? named

Default value None

Accept pipeline input? False

Accept wildcard characters? false

-DefaultOutboundAction <Action>

Specifies how to filter outbound traffic that does not match any Hyper-V firewall rules.

This setting applies the configuration to all profiles. For configuring at a per-profile granularity, use the `Set-NetFirewallHyperVProfile` cmdlet.

The acceptable values for this parameter are: NotConfigured, Allow, or Block.

- Block: Blocks outbound network traffic that does not match an outbound rule.

- Allow: Allows all outbound network traffic, whether or not it matches an outbound rule.		
- NotConfigured: Resets this value back to its default.		
The default setting is Block.		
Required? false		
Position? named		
Default value None		
Accept pipeline input? False		
Accept wildcard characters? false		
-Enabled <gpoboolean></gpoboolean>		
Determines whether or not the Hyper-V firewall is active and enforced.		
This setting applies the configuration to all profiles. For configuring at a per-profile granularity, use the		
`Set-NetFirewallHyperVProfile` cmdlet.		
The acceptable values for this parameter are: False, True, or NotConfigured.		
- True: Enables Windows Hyper-V firewall.		
- False: Disables Windows Hyper-V firewall.		
- NotConfigured: Resets this value back to its default.		
The default setting is True.		

Required? false Page 4/9

	Position?	named	
	Default value	None	
	Accept pipeline input? False		
	Accept wildcard characters? false		
-L	-LoopbackEnabled <gpoboolean></gpoboolean>		
	Determines whether or not guest-host loopback traffic is allowed.		
	This setting is orthogo	onal to any existing Hyper-V firewall rules. That is, both this setting and the set of Hyper-V firewall	
rules	s must both be configu	red to	
	allow guest-host com	munication. Furthermore, if either this setting or a Hyper-V firewall rule blocks the communication,	
it wil	l be blocked.		
	The acceptable values for this parameter are: False, True, or NotConfigured.		
	- True: Hyper-V firewall allows traffic between guest and host.		
	- False: Hyper-V firewall blocks traffic between guest and host.		
	- NotConfigured: Resets this value back to its default.		
	The default setting is False.		
	Required?	false	
		named	
	Default value	None	
	Accept pipeline input? False		
	Accept wildcard characters? false		
	,		

Page 5/9

-AllowHostPolicyMerge <GpoBoolean>

This setting controls whether host firewall profile settings (DefaultInboundAction, DefaultOutboundAction, Enabled, and

AllowLocalFirewallRules) as well as host

firewall rules (only rules that are IP 5-tuple based, that is, not having any local conditions such as application) should

be applicable to Hyper-V firewall.

Policy configurations may come from many stores. If this setting is True, the following order of precedence is used for

determining the effective policy (highest

priority to lowest priority): - Host Firewall Group Policy

- Hyper-V Firewall MDM

- Host Firewall MDM

- Hyper-V Firewall Local

- Host Firewall Local

The acceptable values for this parameter are: False, True, or NotConfigured.

- True: Host firewall rules and settings are applied to Hyper-V firewall.

- False: Host firewall rules and settings are not applied to Hyper-V firewall

- NotConfigured: Resets this value back to its default.

The default setting is True.

Required? false

Position? named Page 6/9

Default value None

Accept pipeline input? False

Accept wildcard characters? false

### -Name <String>

Specifies that the settings are applicable only to the Hyper-V firewall VM creator with the matching Id. The format for this value is a GUID enclosed in brackets:

'{9E288F02-CE00-4D9E-BE2B-14CE463B0298}'.

Required? false

Position? named

Default value None

Accept pipeline input? False

Accept wildcard characters? false

### -ThrottleLimit <Int32>

Specifies the maximum number of concurrent operations that can be established to run the cmdlet. If this parameter is omitted or a value of `0` is entered,

Windows PowerShell calculates an optimum throttle limit for the cmdlet based on the number of CIM cmdlets that are running on the computer.

The throttle limit applies only to the current cmdlet, not to the session or to the computer.

Required? false

Position? named

Default value None

Accept pipeline input? False

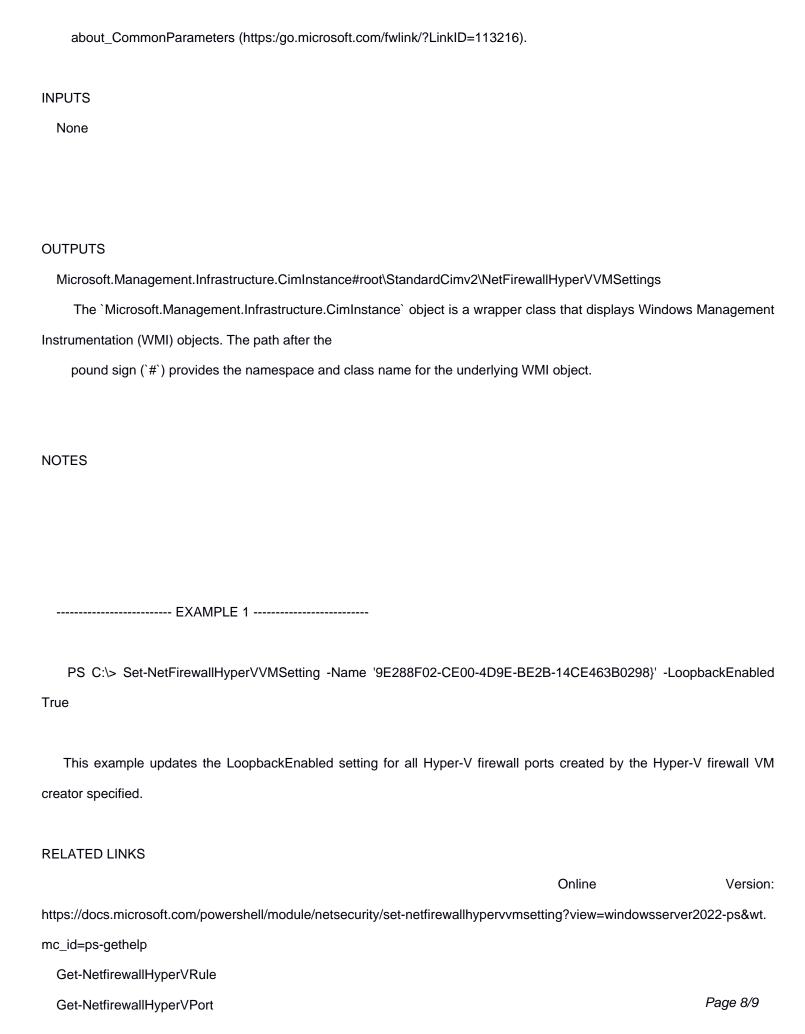

Accept wildcard characters? false

#### <CommonParameters>

This cmdlet supports the common parameters: Verbose, Debug,

ErrorAction, ErrorVariable, WarningAction, WarningVariable,

OutBuffer, PipelineVariable, and OutVariable. For more information, see
