SYNOPSIS

```
#include <openssl/evp.h>
```

```
const EVP_CIPHER *EVP_ciphertype(void)
```

EVP_ciphertype is used a placeholder for any of the described cipher functions, such as EVP_aria_128_cbc.

DESCRIPTION

The ARIA encryption algorithm for EVP.

ARIA for 128, 192 and 256 bit keys in the following modes: CBC, CFB
with 128-bit shift, CFB with 1-bit shift, CFB with 8-bit shift,
CTR, ECB and OFB.

EVP_aria_128_ccm(), EVP_aria_192_ccm(), EVP_aria_256_ccm(),
EVP_aria_128_gcm(), EVP_aria_192_gcm(), EVP_aria_256_gcm(),

ARIA for 128, 192 and 256 bit keys in CBC-MAC Mode (CCM) and Galois
Counter Mode (GCM). These ciphers require additional control
operations to function correctly, see the "AEAD Interface" in
EVP_EncryptInit(3) section for details.

RETURN VALUES

These functions return an EVP_CIPHER structure that contains the
implementation of the symmetric cipher. See EVP_CIPHER_meth_new(3) for
details of the EVP_CIPHER structure.
