Red Hat Enterprise Linux Release 9.2 Manual Pages on 'SSL_set_tlsext_status_ocsp_resp.3ossl' command

`$ man SSL_set_tlsext_status_ocsp_resp.3ossl`

SSL_CTX_SET_TLSEXT_STATUS_CB(3ossl) OpenSSLSSL_CTX_SET_TLSEXT_STATUS_CB(3ossl)

NAME

SSL_CTX_set_tlsext_status_cb, SSL_CTX_get_tlsext_status_cb,
SSL_CTX_set_tlsext_status_arg, SSL_CTX_get_tlsext_status_arg,
SSL_CTX_set_tlsext_status_type, SSL_CTX_get_tlsext_status_type,
SSL_set_tlsext_status_type, SSL_get_tlsext_status_type,
SSL_get_tlsext_status_ocsp_resp, SSL_set_tlsext_status_ocsp_resp - OCSP
Certificate Status Request functions

SYNOPSIS

```
#include <openssl/tls1.h>
```

```
long SSL_CTX_set_tlsext_status_cb(SSL_CTX *ctx, int (*callback)(SSL *, void *));
```

```
long SSL_CTX_get_tlsext_status_cb(SSL_CTX *ctx, int (**callback)(SSL *, void *));
```

```
long SSL_CTX_set_tlsext_status_arg(SSL_CTX *ctx, void *arg);
```

```
long SSL_CTX_get_tlsext_status_arg(SSL_CTX *ctx, void **arg);
```

```
long SSL_CTX_set_tlsext_status_type(SSL_CTX *ctx, int type);
```

```
long SSL_CTX_get_tlsext_status_type(SSL_CTX *ctx);
```

```
long SSL_set_tlsext_status_type(SSL *s, int type);
```

```
long SSL_get_tlsext_status_type(SSL *s);
```

```
long SSL_get_tlsext_status_ocsp_resp(ssl, unsigned char **resp);
```

```
long SSL_set_tlsext_status_ocsp_resp(ssl, unsigned char *resp, int len);
```

DESCRIPTION

A client application may request that a server send back an OCSP status response (also known as OCSP stapling). To do so the client should call the `SSL_CTX_set_tlsext_status_type()` function prior to the creation of any SSL objects. Alternatively an application can call the `SSL_set_tlsext_status_type()` function on an individual SSL object prior to the start of the handshake. Currently the only supported type is `TLSEXT_STATUSTYPE_ocsp`. This value should be passed in the `type` argument. Calling `SSL_CTX_get_tlsext_status_type()` will return the type `TLSEXT_STATUSTYPE_ocsp` previously set via `SSL_CTX_set_tlsext_status_type()` or `-1` if not set.

The client should additionally provide a callback function to decide what to do with the returned OCSP response by calling `SSL_CTX_set_tlsext_status_cb()`. The callback function should determine whether the returned OCSP response is acceptable or not. The callback will be passed as an argument the value previously set via a call to `SSL_CTX_set_tlsext_status_arg()`. Note that the callback will not be called in the event of a handshake where session resumption occurs (because there are no Certificates exchanged in such a handshake). The callback previously set via `SSL_CTX_set_tlsext_status_cb()` can be retrieved by calling `SSL_CTX_get_tlsext_status_cb()`, and the argument by calling `SSL_CTX_get_tlsext_status_arg()`.

On the client side `SSL_get_tlsext_status_type()` can be used to determine whether the client has previously called `SSL_set_tlsext_status_type()`. It will return `TLSEXT_STATUSTYPE_ocsp` if it has been called or `-1` otherwise. On the server side

SSL_get_tlsext_status_type() can be used to determine whether the client requested OCSP stapling. If the client requested it then this function will return TLSEXT_STATUSTYPE_ocsp, or -1 otherwise.

The response returned by the server can be obtained via a call to SSL_get_tlsext_status_ocsp_resp(). The value *resp will be updated to point to the OCSP response data and the return value will be the length of that data. Typically a callback would obtain an OCSP_RESPONSE object from this data via a call to the d2i_OCSP_RESPONSE() function. If the server has not provided any response data then *resp will be NULL and the return value from SSL_get_tlsext_status_ocsp_resp() will be -1.

A server application must also call the SSL_CTX_set_tlsext_status_cb() function if it wants to be able to provide clients with OCSP Certificate Status responses. Typically the server callback would obtain the server certificate that is being sent back to the client via a call to SSL_get_certificate(); obtain the OCSP response to be sent back; and then set that response data by calling SSL_set_tlsext_status_ocsp_resp(). A pointer to the response data should be provided in the resp argument, and the length of that data should be in the len argument.

RETURN VALUES

The callback when used on the client side should return a negative value on error; 0 if the response is not acceptable (in which case the handshake will fail) or a positive value if it is acceptable.

The callback when used on the server side should return with either SSL_TLSEXT_ERR_OK (meaning that the OCSP response that has been set should be returned), SSL_TLSEXT_ERR_NOACK (meaning that an OCSP response should not be returned) or SSL_TLSEXT_ERR_ALERT_FATAL (meaning that a fatal error has occurred).

SSL_CTX_set_tlsext_status_cb(), SSL_CTX_set_tlsext_status_arg(),
SSL_CTX_set_tlsext_status_type(), SSL_set_tlsext_status_type() and
SSL_set_tlsext_status_ocsp_resp() return 0 on error or 1 on success.

SSL_CTX_get_tlsext_status_type() returns the value previously set by
SSL_CTX_set_tlsext_status_type(), or -1 if not set.

SSL_get_tlsext_status_ocsp_resp() returns the length of the OCSP
response data or -1 if there is no OCSP response data.

SSL_get_tlsext_status_type() returns TLSEXT_STATUSTYPE_ocsp on the
client side if SSL_set_tlsext_status_type() was previously called, or
on the server side if the client requested OCSP stapling. Otherwise -1
is returned.

HISTORY

The SSL_get_tlsext_status_type(), SSL_CTX_get_tlsext_status_type() and
SSL_CTX_set_tlsext_status_type() functions were added in OpenSSL 1.1.0.
