Red Hat Enterprise Linux Release 9.2 Manual Pages on 'clock_nanosleep.3p' command

\$ man clock_nanosleep.3p

CLOCK_NANOSLEEP(3P) POSIX Programmer's Manual CLOCK_NANOSLEEP(3P)

PROLOG

This manual page is part of the POSIX Programmer's Manual. The Linux implementation of this interface may differ (consult the corresponding Linux manual page for details of Linux behavior), or the interface may not be implemented on Linux.

NAME

clock_nanosleep ? high resolution sleep with specifiable clock

SYNOPSIS

```
#include <time.h>

int clock_nanosleep(clockid_t clock_id, int flags,
    const struct timespec *rqtp, struct timespec *rmtp);
```

DESCRIPTION

If the flag `TIMER_ABSTIME` is not set in the `flags` argument, the `clock_nanosleep()` function shall cause the current thread to be suspended from execution until either the time interval specified by the `rqtp` argument has elapsed, or a signal is delivered to the calling thread and its action is to invoke a signal-catching function, or the process is terminated. The clock used to measure the time shall be the clock specified by `clock_id`.

If the flag `TIMER_ABSTIME` is set in the `flags` argument, the `clock_nanosleep()` function shall cause the current thread to be suspended from execution until either the time value of the clock speci?

ified by `clock_id` reaches the absolute time specified by the `rqtp` argument, or a signal is delivered to the calling thread and its action is to invoke a signal-catching function, or the process is terminated. If, at the time of the call, the time value specified by `rqtp` is less than or equal to the time value of the specified clock, then `clock_nanosleep()` shall return immediately and the calling process shall not be suspended.

The suspension time caused by this function may be longer than requested because the argument value is rounded up to an integer multiple of the sleep resolution, or because of the scheduling of other activity by the system. But, except for the case of being interrupted by a signal, the suspension time for the relative `clock_nanosleep()` function (that is, with the `TIMER_ABSTIME` flag not set) shall not be less than the time interval specified by `rqtp`, as measured by the corresponding clock. The suspension for the absolute `clock_nanosleep()` function (that is, with the `TIMER_ABSTIME` flag set) shall be in effect at least until the value of the corresponding clock reaches the absolute time specified by `rqtp`, except for the case of being interrupted by a signal.

The use of the `clock_nanosleep()` function shall have no effect on the action or blockage of any signal.

The `clock_nanosleep()` function shall fail if the `clock_id` argument refers to the CPU-time clock of the calling thread. It is unspecified whether `clock_id` values of other CPU-time clocks are allowed.

RETURN VALUE

If the `clock_nanosleep()` function returns because the requested time has elapsed, its return value shall be zero.

If the `clock_nanosleep()` function returns because it has been interrupted by a signal, it shall return the corresponding error value. For the relative `clock_nanosleep()` function, if the `rmtp` argument is non-NULL, the `timespec` structure referenced by it shall be updated to contain the amount of time remaining in the interval (the requested time minus the time actually slept). The `rqtp` and `rmtp` arguments can point to the same object. If the `rmtp` argument is NULL, the remaining time is

not returned. The absolute `clock_nanosleep()` function has no effect on the structure referenced by `rntp`.

If `clock_nanosleep()` fails, it shall return the corresponding error value.

ERRORS

The `clock_nanosleep()` function shall fail if:

EINTR The `clock_nanosleep()` function was interrupted by a signal.

EINVAL The `rntp` argument specified a nanosecond value less than zero or greater than or equal to 1000 million; or the `TIMER_ABSTIME` flag was specified in `flags` and the `rntp` argument is outside the range for the clock specified by `clock_id`; or the `clock_id` argument does not specify a known clock, or specifies the CPU-time clock of the calling thread.

ENOTSUP

The `clock_id` argument specifies a clock for which `clock_nanosleep()` is not supported, such as a CPU-time clock.

The following sections are informative.

EXAMPLES

None.

APPLICATION USAGE

Calling `clock_nanosleep()` with the value `TIMER_ABSTIME` not set in the `flags` argument and with a `clock_id` of `CLOCK_REALTIME` is equivalent to calling `nanosleep()` with the same `rntp` and `rntp` arguments.

RATIONALE

The `nanosleep()` function specifies that the system-wide clock `CLOCK_REALTIME` is used to measure the elapsed time for this time service. However, with the introduction of the monotonic clock `CLOCK_MONOTONIC` a new relative sleep function is needed to allow an application to take advantage of the special characteristics of this clock.

There are many applications in which a process needs to be suspended and then activated multiple times in a periodic way; for example, to poll the status of a non-interrupting device or to refresh a display device. For these cases, it is known that precise periodic activation

cannot be achieved with a `relative sleep()` or `nanosleep()` function call. Suppose, for example, a periodic process that is activated at time T_0 , executes for a while, and then wants to suspend itself until time T_0+T , the period being T . If this process wants to use the `nanosleep()` function, it must first call `clock_gettime()` to get the current time, then calculate the difference between the current time and T_0+T and, finally, call `nanosleep()` using the computed interval. However, the process could be preempted by a different process between the two function calls, and in this case the interval computed would be wrong; the process would wake up later than desired. This problem would not occur with the absolute `clock_nanosleep()` function, since only one function call would be necessary to suspend the process until the desired time. In other cases, however, a relative sleep is needed, and that is why both functionalities are required.

Although it is possible to implement periodic processes using the timers interface, this implementation would require the use of signals, and the reservation of some signal numbers. In this regard, the reasons for including an absolute version of the `clock_nanosleep()` function in POSIX.1?2008 are the same as for the inclusion of the relative `nanosleep()`.

It is also possible to implement precise periodic processes using `pthread_cond_timedwait()`, in which an absolute timeout is specified that takes effect if the condition variable involved is never signaled.

However, the use of this interface is unnatural, and involves performing other operations on mutexes and condition variables that imply an unnecessary overhead. Furthermore, `pthread_cond_timedwait()` is not available in implementations that do not support threads.

Although the interface of the relative and absolute versions of the new high resolution sleep service is the same `clock_nanosleep()` function, the `rmtp` argument is only used in the relative sleep. This argument is needed in the relative `clock_nanosleep()` function to reissue the function call if it is interrupted by a signal, but it is not needed in the absolute `clock_nanosleep()` function call; if the call is interrupted by

a signal, the absolute `clock_nanosleep()` function can be invoked again with the same `rqtp` argument used in the interrupted call.

FUTURE DIRECTIONS

None.
