## **Red Hat Enterprise Linux Release 9.2 Manual Pages on 'javap.1' command**

**\$ man javap.1**

javap(1) Basic Tools javap(1)

### **NAME**

javap - Disassembles one or more class files.

### **SYNOPSIS**

javap [options] classfile...

#### **options**

The command-line options. See Options.

#### **classfile**

One or more classes separated by spaces to be processed for annotations such as DocFooter.class. You can specify a class that can be found in the class path, by its file name or with a URL such as file:///home/user/myproject/src/DocFooter.class.

### **DESCRIPTION**

The javap command disassembles one or more class files. The output depends on the options used. When no options are used, then the javap command prints the package, protected and public fields, and methods of the classes passed to it. The javap command prints its output to stdout.

### **OPTIONS**

-help

--help

-?

Prints a help message for the javap command.

**-version**

Prints release information.

**-l**

Prints line and local variable tables.

**-public**

Shows only public classes and members.

**-protected**

Shows only protected and public classes and members.

**-private**

**-p**

Shows all classes and members.

**-Joption**

Passes the specified option to the JVM. For example:

```
javap -J-version
```

```
javap -J-Djava.security.manager -J-Djava.security.policy=MyPolicy MyClassName
```

For more information about JVM options, see the command

documentation.

**-s**

Prints internal type signatures.

**-sysinfo**

Shows system information (path, size, date, MD5 hash) of the class  
being processed.

**-constants**

Shows static final constants.

**-c**

Prints disassembled code, for example, the instructions that  
comprise the Java bytecodes, for each of the methods in the class.

**-verbose**

Prints stack size, number of locals and arguments for methods.

**-classpath path**

Specifies the path the javap command uses to look up classes.

Overrides the default or the CLASSPATH environment variable when it  
is set.

**-bootclasspath path**

Specifies the path from which to load bootstrap classes. By default, the bootstrap classes are the classes that implement the core Java platform located in jre/lib/rt.jar and several other JAR files.

**-extdir dirs**

Overrides the location at which installed extensions are searched for. The default location for extensions is the value of java.ext.dirs.

**EXAMPLE**

Compile the following DocFooter class:

```
import java.awt.*;
import java.applet.*;
public class DocFooter extends Applet {
    String date;
    String email;
    public void init() {
        resize(500,100);
        date = getParameter("LAST_UPDATED");
        email = getParameter("EMAIL");
    }
    public void paint(Graphics g) {
        g.drawString(date + " by ",100, 15);
        g.drawString(email,290,15);
    }
}
```

The output from the javap DocFooter.class command yields the following:

```
Compiled from "DocFooter.java"
public class DocFooter extends java.applet.Applet {
    java.lang.String date;
    java.lang.String email;
    public DocFooter();
    public void init();
```

```
public void paint(java.awt.Graphics);  
}
```

The output from javap -c DocFooter.class command yields the following:

```
Compiled from "DocFooter.java"  
  
public class DocFooter extends java.applet.Applet {  
  
    java.lang.String date;  
  
    java.lang.String email;  
  
    public DocFooter();
```

Code:

```
0: aload_0  
1: invokespecial #1           // Method
```

```
java/applet/Applet."<init>":()V
```

```
4: return
```

```
public void init();
```

Code:

```
0: aload_0  
1: sipush     500  
4: bipush     100  
6: invokevirtual #2          // Method resize:(II)V  
9: aload_0  
10: aload_0  
11: ldc       #3           // String LAST_UPDATED  
13: invokevirtual #4          // Method
```

```
getParameter:(Ljava/lang/String;)Ljava/lang/String;
```

```
16: putfield   #5           // Field date:Ljava/lang/String;  
19: aload_0  
20: aload_0  
21: ldc       #6           // String EMAIL  
23: invokevirtual #4          // Method
```

```
getParameter:(Ljava/lang/String;)Ljava/lang/String;
```

```
26: putfield   #7           // Field email:Ljava/lang/String;  
29: return
```

```
public void paint(java.awt.Graphics);
```

Code:

```
0: aload_1
1: new      #8           // class java/lang/StringBuilder
4: dup
5: invokespecial #9       // Method
   java/lang/StringBuilder."<init>":()V
8: aload_0
9: getfield  #5           // Field date:Ljava/lang/String;
12: invokevirtual #10      // Method
   java/lang/StringBuilder.append:(Ljava/lang/String;)Ljava/lang/StringBuilder;
15: ldc      #11          // String by
17: invokevirtual #10      // Method
   java/lang/StringBuilder.append:(Ljava/lang/String;)Ljava/lang/StringBuilder;
20: invokevirtual #12      // Method
   java/lang/StringBuilder.toString:()Ljava/lang/String;
23: bipush   100
25: bipush   15
27: invokevirtual #13      // Method
   java.awt/Graphics.drawString:(Ljava/lang/String;II)V
30: aload_1
31: aload_0
32: getfield  #7           // Field email:Ljava/lang/String;
35: sipush   290
38: bipush   15
40: invokevirtual #13      // Method
   java.awt/Graphics.drawString:(Ljava/lang/String;II)V
43: return
}
```
