Red Hat Enterprise Linux Release 9.2 Manual Pages on 'npm-adduser.1' command

$ man npm-adduser.1

NPM-ADDUSER(1)   NPM-ADDUSER(1)

NAME

   npm-adduser - Add a registry user account

 Synopsis

    npm adduser

    aliases: login, add-user

   Note: This command is unaware of workspaces.

 Description

   Create or verify a user named <username> in the specified registry, and

   save the credentials to the .npmrc file. If no registry is specified,

   the default registry will be used (see npm help config).

   The username, password, and email are read in from prompts.

   To reset your password, go to https://www.npmjs.com/forgot

   To change your email address, go to https://www.npmjs.com/email-edit

   You may use this command multiple times with the same user account to

   authorize on a new machine. When authenticating on a new machine, the

   username, password and email address must all match with your existing

   record.

   npm login is an alias to adduser and behaves exactly the same way.

 Configuration

 registry

   ? Default: "https://registry.npmjs.org/"

   ? Type: URL

The base URL of the npm registry.

scope

? Default: the scope of the current project, if any, or ""

? Type: String

Associate an operation with a scope for a scoped registry.

Useful when logging in to or out of a private registry:

    # log in, linking the scope to the custom registry

    npm login --scope=@mycorp --registry=https://registry.mycorp.com

    # log out, removing the link and the auth token

    npm logout --scope=@mycorp

This will cause @mycorp to be mapped to the registry for future instal?

lation of packages specified according to the pattern @mycorp/package.

This will also cause npm init to create a scoped package.

    # accept all defaults, and create a package named "@foo/whatever",

    # instead of just named "whatever"

    npm init --scope=@foo --yes

auth-type

? Default: "legacy"

? Type: "legacy", "web", "sso", "saml", "oauth", or "webauthn"

NOTE: auth-type values "sso", "saml", "oauth", and "webauthn" will be

removed in a future version.

What authentication strategy to use with login.
