Red Hat Enterprise Linux Release 9.2 Manual Pages on 'npm-edit.1' command

\$ man npm-edit.1

NPM-EDIT(1)

NPM-EDIT(1)

NAME

npm-edit - Edit an installed package

Synopsis

npm edit <pkg>[/<subpkg>...]

Note: This command is unaware of workspaces.

Description

Selects a dependency in the current project and opens the package

folder in the default editor (or whatever you've configured as the npm

editor config -- see npm-config npm-config).

After it has been edited, the package is rebuilt so as to pick up any changes in compiled packages.

For instance, you can do npm install connect to install connect into your package, and then npm edit connect to make a few changes to your locally installed copy.

Configuration

editor

? Default: The EDITOR or VISUAL environment variables, or 'notepad.exe' on Windows, or 'vim' on Unix systems

? Type: String

The command to run for npm edit and npm config edit.
