Red Hat Enterprise Linux Release 9.2 Manual Pages on 'ostree-cat.1' command

$ man ostree-cat.1

OSTREE CAT(1)   ostree cat   OSTREE CAT(1)

NAME

    ostree-cat - Display or concatenate contents of files

SYNOPSIS

    ostree cat {COMMIT} {PATH...}

DESCRIPTION

    This command functions much like the typical Unix "cat" command, in

    that it displays the contents of a file, or concatenates them given two

    or more files. However, this command requires the user to specify a

    commit - a checksum or refspec corresponding to a given build. If you

    use a refspec, OSTree will refer to the most recent commit, unless you

    specify a parent build using the carat (^) at the end of the refspec.

    It will then operate the command in that given commit.

EXAMPLE

    $ ostree cat my-branch helloworld.txt

        Hello, world!

OSTree   OSTREE CAT(1)
