

Red Hat Enterprise Linux Release 9.2 Manual Pages on 'podman-machine.1' command

\$ man podman-machine.1

podman-machine(1) General Commands Manual podman-machine(1)

NAME

podman-machine - Manage Podman's virtual machine

SYNOPSIS

podman machine subcommand

DESCRIPTION

podman machine is a set of subcommands that manage Podman's virtual machine.

Podman on MacOS and Windows requires a virtual machine. This is because containers are Linux - containers do not run on any other OS because containers' core functionality are tied to the Linux kernel. Podman machine must be used to manage MacOS and Windows machines, but can be optionally used on Linux.

All podman machine commands are rootless only.

NOTE: The podman-machine configuration file is managed under the \$XDG_CONFIG_HOME/containers/podman/machine/ directory. Changing the \$XDG_CONFIG_HOME environment variable while the machines are running can lead to unexpected behavior.

SUBCOMMANDS

??

?Command	? Man Page	? Description	?
----------	------------	---------------	---

??

?info	? podman-machine-info(1)	? Display machine host info	?
-------	--------------------------	-----------------------------	---

??
?init ? podman-machine-init(1) ? Initialize a new virtual ma? ?
? ? ? chine ?
??
?inspect ? podman-machine-inspect(1) ? Inspect one or more virtual ?
? ? ? machines ?
??
?list ? podman-machine-list(1) ? List virtual machines ?
??
?rm ? podman-machine-rm(1) ? Remove a virtual machine ?
??
?set ? podman-machine-set(1) ? Sets a virtual machine setting ?
??
?ssh ? podman-machine-ssh(1) ? SSH into a virtual machine ?
??
?start ? podman-machine-start(1) ? Start a virtual machine ?
??
?stop ? podman-machine-stop(1) ? Stop a virtual machine ?
??
