`$ man pthread_mutexattr_getprotocol.3p`

PTHREAD_MUTEXATTR_GETPROTOCOL(3P) Programmer's Manual: PTHREAD_MUTEXATTR_GETPROTOCOL(3P)

PROLOG

This manual page is part of the POSIX Programmer's Manual. The Linux implementation of this interface may differ (consult the corresponding Linux manual page for details of Linux behavior), or the interface may not be implemented on Linux.

NAME

`pthread_mutexattr_getprotocol`, `pthread_mutexattr_setprotocol` ? get and set the `protocol` attribute of the mutex attributes object (REALTIME THREADS)

SYNOPSIS

```
#include <pthread.h>

int pthread_mutexattr_getprotocol(const pthread_mutexattr_t
    *restrict attr, int *restrict protocol);

int pthread_mutexattr_setprotocol(pthread_mutexattr_t *attr,
    int protocol);
```

DESCRIPTION

The `pthread_mutexattr_getprotocol()` and `pthread_mutexattr_setprotocol()` functions, respectively, shall get and set the `protocol` attribute of a mutex attributes object pointed to by `attr` which was previously created by the function `pthread_mutexattr_init()`.

The `protocol` attribute defines the protocol to be followed in utilizing mutexes. The value of `protocol` may be one of:

PTHREAD_PRIO_INHERIT

PTHREAD_PRIO_NONE

PTHREAD_PRIO_PROTECT

which are defined in the `<pthread.h>` header. The default value of the attribute shall be `PTHREAD_PRIO_NONE`.

When a thread owns a mutex with the `PTHREAD_PRIO_NONE` protocol attribute, its priority and scheduling shall not be affected by its mutex ownership.

When a thread is blocking higher priority threads because of owning one or more robust mutexes with the `PTHREAD_PRIO_INHERIT` protocol attribute, it shall execute at the higher of its priority or the priority of the highest priority thread waiting on any of the robust mutexes owned by this thread and initialized with this protocol.

When a thread is blocking higher priority threads because of owning one or more non-robust mutexes with the `PTHREAD_PRIO_INHERIT` protocol attribute, it shall execute at the higher of its priority or the priority of the highest priority thread waiting on any of the non-robust mutexes owned by this thread and initialized with this protocol.

When a thread owns one or more robust mutexes initialized with the `PTHREAD_PRIO_PROTECT` protocol, it shall execute at the higher of its priority or the highest of the priority ceilings of all the robust mutexes owned by this thread and initialized with this attribute, regardless of whether other threads are blocked on any of these robust mutexes or not.

When a thread owns one or more non-robust mutexes initialized with the `PTHREAD_PRIO_PROTECT` protocol, it shall execute at the higher of its priority or the highest of the priority ceilings of all the non-robust mutexes owned by this thread and initialized with this attribute, regardless of whether other threads are blocked on any of these non-robust mutexes or not.

While a thread is holding a mutex which has been initialized with the `PTHREAD_PRIO_INHERIT` or `PTHREAD_PRIO_PROTECT` protocol attributes, it shall not be subject to being moved to the tail of the scheduling queue

at its priority in the event that its original priority is changed, such as by a call to `sched_setparam()`. Likewise, when a thread unlocks a mutex that has been initialized with the `PTHREAD_PRIO_INHERIT` or `PTHREAD_PRIO_PROTECT` protocol attributes, it shall not be subject to being moved to the tail of the scheduling queue at its priority in the event that its original priority is changed.

If a thread simultaneously owns several mutexes initialized with different protocols, it shall execute at the highest of the priorities that it would have obtained by each of these protocols.

When a thread makes a call to `pthread_mutex_lock()`, the mutex was initialized with the protocol attribute having the value `PTHREAD_PRIO_INHERIT`, when the calling thread is blocked because the mutex is owned by another thread, that owner thread shall inherit the priority level of the calling thread as long as it continues to own the mutex. The implementation shall update its execution priority to the maximum of its assigned priority and all its inherited priorities. Furthermore, if this owner thread itself becomes blocked on another mutex with the protocol attribute having the value `PTHREAD_PRIO_INHERIT`, the same priority inheritance effect shall be propagated to this other owner thread, in a recursive manner.

The behavior is undefined if the value specified by the `attr` argument to `pthread_mutexattr_getprotocol()` or `pthread_mutexattr_setprotocol()` does not refer to an initialized mutex attributes object.

RETURN VALUE

Upon successful completion, the `pthread_mutexattr_getprotocol()` and `pthread_mutexattr_setprotocol()` functions shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The `pthread_mutexattr_setprotocol()` function shall fail if:

ENOTSUP

The value specified by `protocol` is an unsupported value.

The `pthread_mutexattr_getprotocol()` and `pthread_mutexattr_setprotocol()` functions may fail if:

EINVAL The value specified by protocol is invalid.

EPERM The caller does not have the privilege to perform the operation.

These functions shall not return an error code of [EINTR].

The following sections are informative.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

If an implementation detects that the value specified by the attr argument to pthread_mutexattr_getprotocol() or pthread_mutexattr_setprotocol() does not refer to an initialized mutex attributes object, it is recommended that the function should fail and report an [EINVAL] error.

FUTURE DIRECTIONS

None.
