PTHREAD_RWLOCK_DESTROY(3P) POSIX Programmer's Manual PTHREAD_RWLOCK_DESTROY(3P)

PROLOG

This manual page is part of the POSIX Programmer's Manual. The Linux implementation of this interface may differ (consult the corresponding Linux manual page for details of Linux behavior), or the interface may not be implemented on Linux.

NAME

pthread_rwlock_destroy, pthread_rwlock_init ? destroy and initialize a read-write lock object

SYNOPSIS

```
#include <pthread.h>

int pthread_rwlock_destroy(pthread_rwlock_t *rwlock);

int pthread_rwlock_init(pthread_rwlock_t *restrict rwlock,
    const pthread_rwlockattr_t *restrict attr);

pthread_rwlock_t rwlock = PTHREAD_RWLOCK_INITIALIZER;
```

DESCRIPTION

The pthread_rwlock_destroy() function shall destroy the read-write lock object referenced by rwlock and release any resources used by the lock. The effect of subsequent use of the lock is undefined until the lock is reinitialized by another call to pthread_rwlock_init(). An implementation may cause pthread_rwlock_destroy() to set the object referenced by rwlock to an invalid value. Results are undefined if pthread_rwlock_destroy() is called when any thread holds rwlock. Attempting to destroy

an uninitialized read-write lock results in undefined behavior.

The `pthread_rwlock_init()` function shall allocate any resources required to use the read-write lock referenced by `rwlock` and initialize the lock to an unlocked state with attributes referenced by `attr`. If `attr` is `NULL`, the default read-write lock attributes shall be used; the effect is the same as passing the address of a default read-write lock attributes object. Once initialized, the lock can be used any number of times without being reinitialized. Results are undefined if `pthread_rwlock_init()` is called specifying an already initialized read-write lock. Results are undefined if a read-write lock is used without first being initialized.

If the `pthread_rwlock_init()` function fails, `rwlock` shall not be initialized and the contents of `rwlock` are undefined.

See Section 2.9.9, Synchronization Object Copies and Alternative Mappings for further requirements.

In cases where default read-write lock attributes are appropriate, the macro `PTHREAD_RWLOCK_INITIALIZER` can be used to initialize read-write locks. The effect shall be equivalent to dynamic initialization by a call to `pthread_rwlock_init()` with the `attr` parameter specified as `NULL`, except that no error checks are performed.

The behavior is undefined if the value specified by the `attr` argument to `pthread_rwlock_init()` does not refer to an initialized read-write lock attributes object.

RETURN VALUE

If successful, the `pthread_rwlock_destroy()` and `pthread_rwlock_init()` functions shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The `pthread_rwlock_init()` function shall fail if:

EAGAIN The system lacked the necessary resources (other than memory) to initialize another read-write lock.

ENOMEM Insufficient memory exists to initialize the read-write lock.

EPERM The caller does not have the privilege to perform the operation.

These functions shall not return an error code of [EINTR].

The following sections are informative.

EXAMPLES

None.

APPLICATION USAGE

Applications using these and related read-write lock functions may be subject to priority inversion, as discussed in the Base Definitions volume of POSIX.1?2017, Section 3.291, Priority Inversion.

RATIONALE

If an implementation detects that the value specified by the `rwlock` argument to `pthread_rwlock_destroy()` does not refer to an initialized read-write lock object, it is recommended that the function should fail and report an [EINVAL] error.

If an implementation detects that the value specified by the `attr` argument to `pthread_rwlock_init()` does not refer to an initialized read-write lock attributes object, it is recommended that the function should fail and report an [EINVAL] error.

If an implementation detects that the value specified by the `rwlock` argument to `pthread_rwlock_destroy()` or `pthread_rwlock_init()` refers to a locked read-write lock object, or detects that the value specified by the `rwlock` argument to `pthread_rwlock_init()` refers to an already initialized read-write lock object, it is recommended that the function should fail and report an [EBUSY] error.

FUTURE DIRECTIONS

None.
