

Red Hat Enterprise Linux Release 9.2 Manual Pages on 'setsebool.8' command

\$ man setsebool.8

setsebool(8) SELinux Command Line documentation setsebool(8)

NAME

setsebool - set SELinux boolean value

SYNOPSIS

setsebool [-PNV] boolean value | bool1=val1 bool2=val2 ...

DESCRIPTION

setsebool sets the current state of a particular SELinux boolean or a list of booleans to a given value. The value may be 1 or true or on to enable the boolean, or 0 or false or off to disable it.

Without the -P option, only the current boolean value is affected; the boot-time default settings are not changed.

If the -P option is given, all pending values are written to the policy file on disk. So they will be persistent across reboots.

If the -N option is given, the policy on disk is not reloaded into the kernel.

If the -V option is given, verbose error messages will be printed from semanage libraries.

AUTHOR
