

Red Hat Enterprise Linux Release 9.2 Manual Pages on 'setvtrgb.8' command

\$ man setvtrgb.8

SETVTRGB(8) System Manager's Manual SETVTRGB(8)

NAME

setvtrgb - set the virtual terminal RGB colors

SYNOPSIS

setvtrgb [options] vga|FILE|-

DESCRIPTION

The `setvtrgb` command takes a single argument, either the string `vga` , or a path to a file containing the red, green, and blue colors to be used by the Linux virtual terminals.

If you use the `FILE` parameter, `FILE` should be exactly 3 lines of 16 comma-separated decimal values for RED, GREEN, and BLUE.

To seed a valid `FILE` :

```
cat /sys/module/vt/parameters/default_{red,grn,blu} > FILE
```

And then edit the values in `FILE`

OPTIONS

`-C, --console=DEV`

the console device to be used;

`-h, --help`

Prints usage message and exits.

`-V, --version`

Prints version number and exists.

AUTHOR

The utility is written by Alexey Gladkov, Seth Forshee, Dustin Kirk?

land.
