Red Hat Enterprise Linux Release 9.2 Manual Pages on 'sln.8' command

$ man sln.8

SLN(8)	Linux Programmer's Manual	SLN(8)

NAME

   sln - create symbolic links

SYNOPSIS

   sln source dest

   sln filelist

DESCRIPTION

   The sln program creates symbolic links. Unlike the ln(1) program, it

   is statically linked. This means that if for some reason the dynamic

   linker is not working, sln can be used to make symbolic links to dy?

   namic libraries.

   The command line has two forms. In the first form, it creates dest as

   a new symbolic link to source.

   In the second form, filelist is a list of space-separated pathname

   pairs, and the effect is as if sln was executed once for each line of

   the file, with the two pathnames as the arguments.

   The sln program supports no command-line options.

SEE ALSO

   ln(1), ld.so(8), ldconfig(8)

COLOPHON

   This page is part of release 5.10 of the Linux man-pages project. A

   description of the project, information about reporting bugs, and the

   latest   version   of   this   page,   can   be   found   at

https://www.kernel.org/doc/man-pages/.
