SYSTEMD-MODULES-LOAD.SERVsystemd-modules-load.sSYSTEMD-MODULES-LOAD.SERVICE(8)

NAME

systemd-modules-load.service, systemd-modules-load - Load kernel
modules at boot

SYNOPSIS

systemd-modules-load.service
/usr/lib/systemd/systemd-modules-load

DESCRIPTION

systemd-modules-load.service is an early boot service that loads kernel
modules. It reads static configuration from files in /usr/ and /etc/,
but also runtime configuration from /run/ and the kernel command line
(see below).

See modules-load.d(5) for information about the configuration format of
this service and paths where configuration files can be created.

KERNEL COMMAND LINE

systemd-modules-load.service understands the following kernel command
line parameters:

modules_load=, rd.modules_load=

Takes a comma-separated list of kernel modules to statically load
during early boot. The option prefixed with "rd." is read in the
initrd only.
