BN_MOD_MUL_RECIPROCAL(3ossl) OpenSSL BN_MOD_MUL_RECIPROCAL(3ossl)

NAME

BN_mod_mul_reciprocal, BN_div_recip, BN_RECP_CTX_new, BN_RECP_CTX_free,
BN_RECP_CTX_set - modular multiplication using reciprocal

SYNOPSIS

```
#include <openssl/bn.h>
```

```
BN_RECP_CTX *BN_RECP_CTX_new(void);
```

```
void BN_RECP_CTX_free(BN_RECP_CTX *recp);
```

```
int BN_RECP_CTX_set(BN_RECP_CTX *recp, const BIGNUM *m, BN_CTX *ctx);
```

```
int BN_div_recip(BIGNUM *dv, BIGNUM *rem, const BIGNUM *a, BN_RECP_CTX *recp,  
                  BN_CTX *ctx);
```

```
int BN_mod_mul_reciprocal(BIGNUM *r, const BIGNUM *a, const BIGNUM *b,
```

BN_RECP_CTX *recp, BN_CTX *ctx);

DESCRIPTION

BN_mod_mul_reciprocal() can be used to perform an efficient BN_mod_mul(3) operation when the operation will be performed repeatedly with the same modulus. It computes $r=(a*b)\%m$ using $recp=1/m$, which is set as described below. ctx is a previously allocated BN_CTX used for temporary variables.

BN_RECP_CTX_new() allocates and initializes a BN_RECP structure.

BN_RECP_CTX_free() frees the components of the BN_RECP, and, if it was created by BN_RECP_CTX_new(), also the structure itself. If recp is NULL, nothing is done.

BN_RECP_CTX_set() stores m in recp and sets it up for computing $1/m$ and shifting it left by $BN_num_bits(m)+1$ to make it an integer. The result and the number of bits it was shifted left will later be stored in recp.

BN_div_recip() divides a by m using recp. It places the quotient in dv and the remainder in rem.

The BN_RECP_CTX structure cannot be shared between threads.

RETURN VALUES

BN_RECP_CTX_new() returns the newly allocated BN_RECP_CTX, and NULL on error.

BN_RECP_CTX_free() has no return value.

For the other functions, 1 is returned for success, 0 on error. The error codes can be obtained by ERR_get_error(3).
