Rocky Enterprise Linux 9.2 Manual Pages on command '`CMS_SignerInfo_set1_signer_cert.3ossl`'

`$ man CMS_SignerInfo_set1_signer_cert.3ossl`

`CMS_GET0_SIGNERINFOS(3ossl)` `OpenSSL` `CMS_GET0_SIGNERINFOS(3ossl)`

NAME

`CMS_SignerInfo_set1_signer_cert`, `CMS_get0_SignerInfos`,
`CMS_SignerInfo_get0_signer_id`, `CMS_SignerInfo_get0_signature`,
`CMS_SignerInfo_cert_cmp` - CMS signedData signer functions

SYNOPSIS

```
#include <openssl/cms.h>
```

```
STACK_OF(CMS_SignerInfo) *CMS_get0_SignerInfos(CMS_ContentInfo *cms);
```

```
int CMS_SignerInfo_get0_signer_id(CMS_SignerInfo *si, ASN1_OCTET_STRING **keyid,  
                                  X509_NAME **issuer, ASN1_INTEGER **sno);
```

```
ASN1_OCTET_STRING *CMS_SignerInfo_get0_signature(CMS_SignerInfo *si);
```

```
int CMS_SignerInfo_cert_cmp(CMS_SignerInfo *si, X509 *cert);
```

```
void CMS_SignerInfo_set1_signer_cert(CMS_SignerInfo *si, X509 *signer);
```

DESCRIPTION

The function `CMS_get0_SignerInfos()` returns all the `CMS_SignerInfo` structures associated with a CMS signedData structure.

`CMS_SignerInfo_get0_signer_id()` retrieves the certificate signer identifier associated with a specific `CMS_SignerInfo` structure `si`.

Either the keyidentifier will be set in `keyid` or both issuer name and serial number in `issuer` and `sno`.

`CMS_SignerInfo_get0_signature()` retrieves the signature associated with `si` in a pointer to an `ASN1_OCTET_STRING` structure. This pointer returned corresponds to the internal signature value if `si` so it may be read or modified.

`CMS_SignerInfo_cert_cmp()` compares the certificate `cert` against the signer identifier `si`. It returns zero if the comparison is successful and non zero if not.

`CMS_SignerInfo_set1_signer_cert()` sets the signers certificate of `si` to `signer`.

NOTES

The main purpose of these functions is to enable an application to lookup signers certificates using any appropriate technique when the simpler method of `CMS_verify()` is not appropriate.

In typical usage and application will retrieve all `CMS_SignerInfo` structures using `CMS_get0_SignerInfo()` and retrieve the identifier information using `CMS`. It will then obtain the signer certificate by some unspecified means (or return an error if it cannot be found) and set it using `CMS_SignerInfo_set1_signer_cert()`.

Once all signer certificates have been set `CMS_verify()` can be used.

Although CMS_get0_SignerInfos() can return NULL if an error occurs or if there are no signers this is not a problem in practice because the only error which can occur is if the cms structure is not of type signedData due to application error.

RETURN VALUES

CMS_get0_SignerInfos() returns all CMS_SignerInfo structures, or NULL there are no signers or an error occurs.

CMS_SignerInfo_get0_signer_id() returns 1 for success and 0 for failure.

CMS_SignerInfo_cert_cmp() returns 0 for a successful comparison and non zero otherwise.

CMS_SignerInfo_set1_signer_cert() does not return a value.

Any error can be obtained from ERR_get_error(3)
