\$ man buildah-manifest-push.1

buildah-manifest-push(1) General Commands Manual buildah-manifest-push(1)

NAME

buildah-manifest-push - Push a manifest list or image index to a registry.

SYNOPSIS

buildah manifest push [options...] listNameOrIndexName transport:destination

DESCRIPTION

Pushes a manifest list or image index to a registry.

RETURN VALUE

The list image's ID and the digest of the image's manifest.

OPTIONS

--all

Push the images mentioned in the manifest list or image index, in addition to the list or index itself.

--authfile path

Path of the authentication file. Default is \${XDG_RUNTIME_DIR}/containers/auth.json, which is set using buildah login. If the authorization

state is not found there, `$HOME/.docker/config.json` is checked, which is set using `docker login`.

`--cert-dir path`

Use certificates at path (`*.crt`, `*.cert`, `*.key`) to connect to the registry. The default certificates directory is `/etc/containers/certs.d`.

`--creds creds`

The `[username:password]` to use to authenticate with the registry if required. If one or both values are not supplied, a command line prompt will appear and the value can be entered. The password is entered without echo.

`--digestfile Digestfile`

After copying the image, write the digest of the resulting image to the file.

`--format, -f`

Manifest list type (`oci` or `v2s2`) to use when pushing the list (default is `oci`).

`--quiet, -q`

Don't output progress information when pushing lists.

`--remove-signatures`

Don't copy signatures when pushing images.

`--rm`

Delete the manifest list or image index from local storage if pushing succeeds.

`--sign-by fingerprint`

Sign the pushed images using the GPG key that matches the specified fingerprint.

`--tls-verify bool-value`

Require HTTPS and verification of certificates when talking to container registries (defaults to `true`). TLS verification cannot be used when talking to an insecure registry.

EXAMPLE

```
buildah manifest push mylist:v1.11 registry.example.org/mylist:v1.11
```
