Rocky Enterprise Linux 9.2 Manual Pages on command 'bundle-binstubs.1'

$ man bundle-binstubs.1

BUNDLE-BINSTUBS(1)   BUNDLE-BINSTUBS(1)

NAME

    bundle-binstubs - Install the binstubs of the listed gems

SYNOPSIS

    bundle binstubs GEM_NAME [--force] [--path PATH] [--standalone]

DESCRIPTION

    Binstubs are scripts that wrap around executables. Bundler creates a

    small Ruby file (a binstub) that loads Bundler, runs the command, and

    puts it into bin/. Binstubs are a shortcut-or alternative- to always

    using bundle exec. This gives you a file that can be run directly, and

    one that will always run the correct gem version used by the applica?

    tion.

    For example, if you run bundle binstubs rspec-core, Bundler will create

    the file bin/rspec. That file will contain enough code to load Bundler,

    tell it to load the bundled gems, and then run rspec.

    This command generates binstubs for executables in GEM_NAME. Binstubs

    are put into bin, or the --path directory if one has been set. Calling

    binstubs with [GEM [GEM]] will create binstubs for all given gems.

OPTIONS

--force

   Overwrite existing binstubs if they exist.

--path The location to install the specified binstubs to. This defaults

   to bin.

--standalone

   Makes binstubs that can work without depending on Rubygems or

   Bundler at runtime.

--shebang

   Specify a different shebang executable name than the default

   (default ?ruby?)

--all Create binstubs for all gems in the bundle.
