FONTS-CONF(5)

FONTS-CONF(5)

NAME

fonts.conf - Font configuration files

## **SYNOPSIS**

/etc/fonts/fonts.conf

/etc/fonts/fonts.dtd

/etc/fonts/conf.d

\$XDG\_CONFIG\_HOME/fontconfig/conf.d

\$XDG\_CONFIG\_HOME/fontconfig/fonts.conf

~/.fonts.conf.d

~/.fonts.conf

#### **DESCRIPTION**

Fontconfig is a library designed to provide system-wide font configura? tion, customization and application access.

#### **FUNCTIONAL OVERVIEW**

Fontconfig contains two essential modules, the configuration module which builds an internal configuration from XML files and the matching module which accepts font patterns and returns the nearest matching

font.

## FONT CONFIGURATION

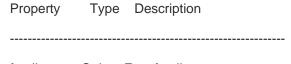

The configuration module consists of the FcConfig datatype, libexpat and FcConfigParse which walks over an XML tree and amends a configura? tion with data found within. From an external perspective, configura? tion of the library consists of generating a valid XML tree and feeding that to FcConfigParse. The only other mechanism provided to applica? tions for changing the running configuration is to add fonts and direc? tories to the list of application-provided font files.

The intent is to make font configurations relatively static, and shared by as many applications as possible. It is hoped that this will lead to more stable font selection when passing names from one application to another. XML was chosen as a configuration file format because it pro? vides a format which is easy for external agents to edit while retain? ing the correct structure and syntax.

Font configuration is separate from font matching; applications needing to do their own matching can access the available fonts from the li? brary and perform private matching. The intent is to permit applica? tions to pick and choose appropriate functionality from the library in? stead of forcing them to choose between this library and a private con? figuration mechanism. The hope is that this will ensure that configura? tion of fonts for all applications can be centralized in one place. Centralizing font configuration will simplify and regularize font in? stallation and customization.

## **FONT PROPERTIES**

While font patterns may contain essentially any properties, there are some well known properties with associated types. Fontconfig uses some of these properties for font matching and font completion. Others are provided as a convenience for the applications' rendering mechanism.

family String Font family names

familylang String Languages corresponding to each family

style String Font style. Overrides weight and slant

stylelang String Languages corresponding to each style

fullname String Font full names (often includes style)

fullnamelang String Languages corresponding to each fullname

slant Int Italic, oblique or roman

weight Int Light, medium, demibold, bold or black

size Double Point size

width Int Condensed, normal or expanded

aspect Double Stretches glyphs horizontally before hinting

pixelsize Double Pixel size

spacing Int Proportional, dual-width, monospace or charcell

foundry String Font foundry name

antialias Bool Whether glyphs can be antialiased

hinting Bool Whether the rasterizer should use hinting

hintstyle Int Automatic hinting style

verticallayout Bool Use vertical layout

autohint Bool Use autohinter instead of normal hinter

globaladvance Bool Use font global advance data (deprecated)

file String The filename holding the font

index Int The index of the font within the file

ftface FT\_Face Use the specified FreeType face object

rasterizer String Which rasterizer is in use (deprecated)

outline Bool Whether the glyphs are outlines

scalable Bool Whether glyphs can be scaled

color Bool Whether any glyphs have color

scale Double Scale factor for point->pixel conversions (deprecated)

dpi Double Target dots per inch

rgba Int unknown, rgb, bgr, vrgb, vbgr,

none - subpixel geometry

lcdfilter Int Type of LCD filter

minspace Bool Eliminate leading from line spacing

charset CharSet Unicode chars encoded by the font

lang String List of RFC-3066-style languages this

#### font supports

fontversion Int Version number of the font

capability String List of layout capabilities in the font

fontformat String String name of the font format

embolden Bool Rasterizer should synthetically embolden the font

embeddedbitmap Bool Use the embedded bitmap instead of the outline

decorative Bool Whether the style is a decorative variant

fontfeatures String List of the feature tags in OpenType to be enabled

namelang String Language name to be used for the default value of

familylang, stylelang, and fullnamelang

prgname String String Name of the running program

postscriptname String Font family name in PostScript

fonthashint Bool Whether the font has hinting

order Int Order number of the font

#### **FONT MATCHING**

pattern to all of the available fonts in the system. The closest match? ing font is selected. This ensures that a font will always be returned, but doesn't ensure that it is anything like the requested pattern.

Font matching starts with an application constructed pattern. The de? sired attributes of the resulting font are collected together in a pat? tern. Each property of the pattern can contain one or more values; these are listed in priority order; matches earlier in the list are considered "closer" than matches later in the list.

The initial pattern is modified by applying the list of editing in? structions specific to patterns found in the configuration; each con? sists of a match predicate and a set of editing operations. They are executed in the order they appeared in the configuration. Each match causes the associated sequence of editing operations to be applied.

After the pattern has been edited, a sequence of default substitutions

are performed to canonicalize the set of available properties; this

avoids the need for the lower layers to constantly provide default val?

ues for various font properties during rendering.

Fontconfig performs matching by measuring the distance from a provided

The canonical font pattern is finally matched against all available fonts. The distance from the pattern to the font is measured for each of several properties: foundry, charset, family, lang, spacing, pixel? size, style, slant, weight, antialias, rasterizer and outline. This list is in priority order -- results of comparing earlier elements of this list weigh more heavily than later elements.

There is one special case to this rule; family names are split into two bindings; strong and weak. Strong family names are given greater prece? dence in the match than lang elements while weak family names are given lower precedence than lang elements. This permits the document language to drive font selection when any document specified font is unavail? able.

The pattern representing that font is augmented to include any proper? ties found in the pattern but not found in the font itself; this per? mits the application to pass rendering instructions or any other data through the matching system. Finally, the list of editing instructions specific to fonts found in the configuration are applied to the pat? tern. This modified pattern is returned to the application.

The return value contains sufficient information to locate and raster? ize the font, including the file name, pixel size and other rendering data. As none of the information involved pertains to the FreeType li? brary, applications are free to use any rasterization engine or even to take the identified font file and access it directly.

The match/edit sequences in the configuration are performed in two passes because there are essentially two different operations necessary -- the first is to modify how fonts are selected; aliasing families and adding suitable defaults. The second is to modify how the selected fonts are rasterized. Those must apply to the selected font, not the original pattern as false matches will often occur.

#### **FONT NAMES**

Fontconfig provides a textual representation for patterns that the li?
brary can both accept and generate. The representation is in three
parts, first a list of family names, second a list of point sizes and

finally a list of additional properties:

<families>-<point sizes>:<name1>=<values1>:<name2>=<values2>...
Values in a list are separated with commas. The name needn't include either families or point sizes; they can be elided. In addition, there are symbolic constants that simultaneously indicate both a name and a value. Here are some examples:

Name Meaning

Times-12 12 point Times Roman

Times-12:bold 12 point Times Bold

Courier:italic Courier Italic in the default size

Monospace:matrix=1 .1 0 1 The users preferred monospace font with artificial obliquing

The '\', '-', ':' and ',' characters in family names must be preceded by a '\' character to avoid having them misinterpreted. Similarly, val? ues containing '\', '=', '\_-', ':' and ',' must also have them preceded by a '\' character. The '\' characters are stripped out of the family name and values as the font name is read.

# **DEBUGGING APPLICATIONS**

To help diagnose font and applications problems, fontconfig is built with a large amount of internal debugging left enabled. It is con? trolled by means of the FC\_DEBUG environment variable. The value of this variable is interpreted as a number, and each bit within that value controls different debugging messages.

| Name    | Value | Meaning                                      |
|---------|-------|--|
|         |       |  |
| MATCH   | 1     | Brief information about font matching        |
| MATCHV  | 2     | Extensive font matching information          |
| EDIT    | 4 N   | Ionitor match/test/edit execution            |
| FONTSET | 8     | Track loading of font information at startup |
| CACHE   | 16    | Watch cache files being written              |
| CACHEV  | 32    | Extensive cache file writing information     |
| PARSE   | 64    | (no longer in use)                           |

SCAN 128 Watch font files being scanned to build caches

SCANV 256 Verbose font file scanning information

MEMORY 512 Monitor fontconfig memory usage

CONFIG 1024 Monitor which config files are loaded

LANGSET 2048 Dump char sets used to construct lang values

MATCH2 4096 Display font-matching transformation in patterns

Add the value of the desired debug levels together and assign that (in base 10) to the FC\_DEBUG environment variable before running the appli? cation. Output from these statements is sent to stdout.

#### LANG TAGS

Each font in the database contains a list of languages it supports.

This is computed by comparing the Unicode coverage of the font with the orthography of each language. Languages are tagged using an RFC-3066 compatible naming and occur in two parts -- the ISO 639 language tag followed a hyphen and then by the ISO 3166 country code. The hyphen and country code may be elided.

Fontconfig has orthographies for several languages built into the li? brary. No provision has been made for adding new ones aside from re? building the library. It currently supports 122 of the 139 languages named in ISO 639-1, 141 of the languages with two-letter codes from ISO 639-2 and another 30 languages with only three-letter codes. Languages with both two and three letter codes are provided with only the two letter code.

For languages used in multiple territories with radically different character sets, fontconfig includes per-territory orthographies. This includes Azerbaijani, Kurdish, Pashto, Tigrinya and Chinese.

#### CONFIGURATION FILE FORMAT

Configuration files for fontconfig are stored in XML format; this for? mat makes external configuration tools easier to write and ensures that they will generate syntactically correct configuration files. As XML files are plain text, they can also be manipulated by the expert user using a text editor.

The fontconfig document type definition resides in the external entity

"fonts.dtd"; this is normally stored in the default font configuration directory (/etc/fonts). Each configuration file should contain the fol? lowing structure:

<?xml version="1.0"?>
<!DOCTYPE fontconfig SYSTEM "urn:fontconfig:fonts.dtd">
<fontconfig>
...

</fontconfig>

# <FONTCONFIG>

This is the top level element for a font configuration and can contain <dir><, <cachedir>, <include>, <match> and <alias> elements in any or?
der.

## <DIR PREFIX="DEFAULT" SALT="">

This element contains a directory name which will be scanned for font files to include in the set of available fonts.

If 'prefix' is set to "default" or "cwd", the current working directory will be added as the path prefix prior to the value. If 'prefix' is set to "xdg", the value in the XDG\_DATA\_HOME environment variable will be added as the path prefix. please see XDG Base Directory Specification for more details. If 'prefix' is set to "relative", the path of current file will be added prior to the value.

'salt' property affects to determine cache filename. this is useful for example when having different fonts sets on same path at container and share fonts from host on different font path.

# <CACHEDIR PREFIX="DEFAULT">

This element contains a directory name that is supposed to be stored or read the cache of font information. If multiple elements are specified in the configuration file, the directory that can be accessed first in the list will be used to store the cache files. If it starts with '~', it refers to a directory in the users home directory. If 'prefix' is set to "xdg", the value in the XDG\_CACHE\_HOME environment variable will be added as the path prefix. please see XDG Base Directory Specifica? tion for more details. The default directory is

"\\$XDG\_CACHE\_HOME/fontconfig" and it contains the cache files named "\chash value>-<architecture>.cache-<version>", where <version> is the fontconfig cache file version number (currently 7).

## <INCLUDE IGNORE\_MISSING="NO" PREFIX="DEFAULT">

This element contains the name of an additional configuration file or directory. If a directory, every file within that directory starting with an ASCII digit (U+0030 - U+0039) and ending with the string ``.conf" will be processed in sorted order. When the XML datatype is traversed by FcConfigParse, the contents of the file(s) will also be incorporated into the configuration by passing the filename(s) to Fc? ConfigLoadAndParse. If 'ignore\_missing' is set to "yes" instead of the default "no", a missing file or directory will elicit no warning mes? sage from the library. If 'prefix' is set to "xdg", the value in the XDG\_CONFIG\_HOME environment variable will be added as the path prefix. please see XDG Base Directory Specification for more details.

# <CONFIG>

This element provides a place to consolidate additional configuration information. <config> can contain <br/> <br/> dank> and <rescan> elements in any order.

#### <DESCRIPTION DOMAIN="FONTCONFIG-CONF">

This element is supposed to hold strings which describe what a config is used for. This string can be translated through gettext. 'domain' needs to be set the proper name to apply then. fontconfig will tries to retrieve translations with 'domain' from gettext.

## <BLANK>

Fonts often include "broken" glyphs which appear in the encoding but are drawn as blanks on the screen. Within the <blank> element, place each Unicode characters which is supposed to be blank in an <int> ele? ment. Characters outside of this set which are drawn as blank will be elided from the set of characters supported by the font.

# <REMAP-DIR PREFIX="DEFAULT" AS-PATH="" SALT="">

This element contains a directory name where will be mapped as the path 'as-path' in cached information. This is useful if the directory name

is an alias (via a bind mount or symlink) to another directory in the system for which cached font information is likely to exist.

'salt' property affects to determine cache filename as same as <dir> element.

#### <RESET-DIRS />

This element removes all of fonts directories where added by <dir> ele? ments. This is useful to override fonts directories from system to own fonts directories only.

# <RESCAN>

The <rescan> element holds an <int> element which indicates the default interval between automatic checks for font configuration changes.

Fontconfig will validate all of the configuration files and directories and automatically rebuild the internal datastructures when this inter? val passes.

#### <SELECTFONT>

This element is used to black/white list fonts from being listed or matched against. It holds acceptfont and rejectfont elements.

## <ACCEPTFONT>

Fonts matched by an acceptfont element are "whitelisted"; such fonts are explicitly included in the set of fonts used to resolve list and match requests; including them in this list protects them from being "blacklisted" by a rejectfont element. Acceptfont elements include glob and pattern elements which are used to match fonts.

## <REJECTFONT>

Fonts matched by an rejectfont element are "blacklisted"; such fonts are excluded from the set of fonts used to resolve list and match re? quests as if they didn't exist in the system. Rejectfont elements in? clude glob and pattern elements which are used to match fonts.

## <GLOB>

Glob elements hold shell-style filename matching patterns (including? and \*) which match fonts based on their complete pathnames. This can be used to exclude a set of directories (/usr/share/fonts/uglyfont\*), or particular font file types (\*.pcf.gz), but the latter mechanism relies

rather heavily on filenaming conventions which can't be relied upon.

Note that globs only apply to directories, not to individual fonts.

#### <PATTERN>

Pattern elements perform list-style matching on incoming fonts; that is, they hold a list of elements and associated values. If all of those elements have a matching value, then the pattern matches the font. This can be used to select fonts based on attributes of the font (scalable, bold, etc), which is a more reliable mechanism than using file exten? sions. Pattern elements include patelt elements.

## <PATELT NAME="PROPERTY">

Patelt elements hold a single pattern element and list of values. They must have a 'name' attribute which indicates the pattern element name. Patelt elements include int, double, string, matrix, bool, charset and const elements.

## <MATCH TARGET="PATTERN">

This element holds first a (possibly empty) list of <test> elements and then a (possibly empty) list of <edit> elements. Patterns which match all of the tests are subjected to all the edits. If 'target' is set to "font" instead of the default "pattern", then this element applies to the font name resulting from a match rather than a font pattern to be matched. If 'target' is set to "scan", then this element applies when the font is scanned to build the fontconfig database.

# <TEST QUAL="ANY" NAME="PROPERTY" TARGET="DEFAULT" COMPARE="EQ">

This element contains a single value which is compared with the target ('pattern', 'font', 'scan' or 'default') property "property" (substi? tute any of the property names seen above). 'compare' can be one of "eq", "not\_eq", "less", "less\_eq", "more", "more\_eq", "contains" or "not\_contains". 'qual' may either be the default, "any", in which case the match succeeds if any value associated with the property matches the test value, or "all", in which case all of the values associated with the property must match the test value. 'ignore-blanks' takes a boolean value. if 'ignore-blanks' is set "true", any blanks in the string will be ignored on its comparison. this takes effects only when

compare="eq" or compare="not\_eq". When used in a <match target="font"> element, the target= attribute in the <test> element selects between matching the original pattern or the font. "default" selects whichever target the outer <match> element has selected.

<EDIT NAME="PROPERTY" MODE="ASSIGN" BINDING="WEAK">
This element contains a list of expression elements (any of the value or operator elements). The expression elements are evaluated at runtime and modify the property "property". The modification depends on whether "property" was matched by one of the associated <test> ele? ments, if so, the modification may affect the first matched value. Any values inserted into the property are given the indicated binding ("strong", "weak" or "same") with "same" binding using the value from the matched pattern element. 'mode' is one of:

Mode With Match Without Match

Replace matching value Replace all values "assign" "assign\_replace" Replace all values Replace all values "prepend" Insert before matching Insert at head of list "prepend first" Insert at head of list Insert at head of list "append" Append after matching Append at end of list "append\_last" Append at end of list Append at end of list "delete" Delete matching value Delete all values "delete all" Delete all values Delete all values

## <INT>, <DOUBLE>, <STRING>, <BOOL>

These elements hold a single value of the indicated type. <bool> ele? ments hold either true or false. An important limitation exists in the parsing of floating point numbers -- fontconfig requires that the man? tissa start with a digit, not a decimal point, so insert a leading zero for purely fractional values (e.g. use 0.5 instead of .5 and -0.5 in? stead of -.5).

# <MATRIX>

This element holds four numerical expressions of an affine transforma? tion. At their simplest these will be four <double> elements but they

can also be more involved expressions.

# <RANGE>

This element holds the two <int> elements of a range representation.

## <CHARSET>

This element holds at least one <int> element of an Unicode code point or more.

# <LANGSET>

This element holds at least one <string> element of a RFC-3066-style languages or more.

## <NAME>

Holds a property name. Evaluates to the first value from the property of the pattern. If the 'target' attribute is not present, it will de? fault to 'default', in which case the property is returned from the font pattern during a target="font" match, and to the pattern during a target="pattern" match. The attribute can also take the values 'font' or 'pattern' to explicitly choose which pattern to use. It is an error to use a target of 'font' in a match that has target="pattern".

## <CONST>

Holds the name of a constant; these are always integers and serve as symbolic names for common font values:

| Constant   | Property | Value |
|------------|----------|-------|
|            |          |       |
| thin       | weight   | 0     |
| extralight | weight   | 40    |
| ultralight | weight   | 40    |
| light      | weight   | 50    |
| demilight  | weight   | 55    |
| semilight  | weight   | 55    |
| book       | weight   | 75    |
| regular    | weight   | 80    |
| normal     | weight   | 80    |
| medium     | weight   | 100   |
| demibold   | weight   | 180   |

| semibold      | weight        | 180 |
|---------------|---------------|-----|
| bold          | weight        | 200 |
| extrabold     | weight        | 205 |
| black         | weight        | 210 |
| heavy         | weight        | 210 |
| roman         | slant         | 0   |
| italic        | slant         | 100 |
| oblique       | slant         | 110 |
| ultraconde    | nsed width    | 50  |
| extraconde    | ensed width   | 63  |
| condensed     | d width       | 75  |
| semiconde     | ensed width   | 87  |
| normal        | width         | 100 |
| semiexpan     | ded width     | 113 |
| expanded      | width         | 125 |
| extraexpar    | nded width    | 150 |
| ultraexpan    | 200           |     |
| proportiona   | al spacing    | 0   |
| dual          | spacing       | 90  |
| mono          | spacing       | 100 |
| charcell      | spacing       | 110 |
| unknown       | rgba          | 0   |
| rgb           | rgba          | 1   |
| bgr           | rgba          | 2   |
| vrgb          | rgba          | 3   |
| vbgr          | rgba          | 4   |
| none          | rgba          | 5   |
| Icdnone       | lcdfilter     | 0   |
| Icddefault    | Icdfilter     | 1   |
| lcdlight      | lcdfilter     | 2   |
| Icdlegacy     | lcdfilter     | 3   |
| hintnone      | hintstyle     | 0   |
| المادة المادة | la la tata da | 4   |

hintslight

hintstyle

hintmedium hintstyle 2

hintfull hintstyle 3

<OR>, <AND>, <PLUS>, <MINUS>, <TIMES>, <DIVIDE>

These elements perform the specified operation on a list of expression elements. <or> and <and> are boolean, not bitwise.</a>

<EQ>, <NOT\_EQ>, <LESS>, <LESS\_EQ>, <MORE>, <MORE\_EQ>, <CONTAINS>, <NOT\_CON?

TAINS

These elements compare two values, producing a boolean result.

<NOT>

Inverts the boolean sense of its one expression element

<IF>

This element takes three expression elements; if the value of the first is true, it produces the value of the second, otherwise it produces the value of the third.

<ALIAS>

Alias elements provide a shorthand notation for the set of common match operations needed to substitute one font family for another. They con? tain a <family> element followed by optional prefer>, <accept> and <default> elements. Fonts matching the <family> element are edited to prepend the list of prefer>ed families before the matching <family>, append the <accept>able families after the matching <family> and append the <default> families to the end of the family list.

<FAMILY>

Holds a single font family name

<PREFER>, <ACCEPT>, <DEFAULT>

These hold a list of <family> elements to be used by the <alias> ele? ment.

## **EXAMPLE CONFIGURATION FILE**

## SYSTEM CONFIGURATION FILE

This is an example of a system-wide configuration file

<?xml version="1.0"?>

<!DOCTYPE fontconfig SYSTEM "urn:fontconfig:fonts.dtd">

<!-- /etc/fonts/fonts.conf file to configure system font access -->

```
<fontconfig>
<!--
  Find fonts in these directories
-->
<dir>/usr/share/fonts</dir>
<dir>/usr/X11R6/lib/X11/fonts</dir>
<!--
  Accept deprecated 'mono' alias, replacing it with 'monospace'
<match target="pattern">
   <test qual="any" name="family"><string>mono</string></test>
   <edit name="family" mode="assign"><string>monospace</string></edit>
</match>
<!--
  Names not including any well known alias are given 'sans-serif'
<match target="pattern">
   <test qual="all" name="family" compare="not_eq"><string>sans-serif</string></test>
   <test qual="all" name="family" compare="not_eq"><string>serif</string></test>
   <test qual="all" name="family" compare="not_eq"><string>monospace</string></test>
   <edit name="family" mode="append_last"><string>sans-serif</string></edit>
</match>
<!--
  Load per-user customization file, but don't complain
  if it doesn't exist
<include ignore_missing="yes" prefix="xdg">fontconfig/fonts.conf</include>
<!--
  Load local customization files, but don't complain
  if there aren't any
<include ignore_missing="yes">conf.d</include>
<include ignore_missing="yes">local.conf</include>
```

```
<!--
  Alias well known font names to available TrueType fonts.
  These substitute TrueType faces for similar Type1
  faces to improve screen appearance.
<alias>
  <family>Times</family>
  family>Times New Roman</family>
  <default><family>serif</family></default>
</alias>
<alias>
  <family>Helvetica</family>
  <default><family>sans</family></default>
</alias>
<alias>
  <family>Courier</family>
  </prefer><family>Courier New</family></prefer></prefer>
  <default><family>monospace</family></default>
</alias>
<!--
  Provide required aliases for standard names
  Do these after the users configuration file so that
  any aliases there are used preferentially
<alias>
  <family>serif</family>
  </alias>
<alias>
  <family>sans</family>
  </prefer></prefer></prefer></prefer></prefer>
</alias>
```

```
<alias>
     <family>monospace</family>
     </prefer><family>Andale Mono</family></prefer>
  </alias>
  <---
     The example of the requirements of OR operator;
     If the 'family' contains 'Courier New' OR 'Courier'
     add 'monospace' as the alternative
  <match target="pattern">
     <test name="family" compare="eq">
        <string>Courier New</string>
     </test>
     <edit name="family" mode="prepend">
        <string>monospace</string>
     </edit>
  </match>
  <match target="pattern">
     <test name="family" compare="eq">
        <string>Courier</string>
     </test>
     <edit name="family" mode="prepend">
        <string>monospace</string>
     </edit>
  </match>
  </fontconfig>
USER CONFIGURATION FILE
  This is an example of a per-user configuration file that lives in
  $XDG_CONFIG_HOME/fontconfig/fonts.conf
  <?xml version="1.0"?>
  <!DOCTYPE fontconfig SYSTEM "urn:fontconfig:fonts.dtd">
  <!-- $XDG_CONFIG_HOME/fontconfig/fonts.conf for per-user font configuration -->
  <fontconfig>
```

```
<!--
  Private font directory
-->
<dir prefix="xdg">fonts</dir>
<!--
  use rgb sub-pixel ordering to improve glyph appearance on
  LCD screens. Changes affecting rendering, but not matching
  should always use target="font".
<match target="font">
   <edit name="rgba" mode="assign"><const>rgb</const></edit>
</match>
<!--
  use WenQuanYi Zen Hei font when serif is requested for Chinese
-->
<match>
   <!--
      If you don't want to use WenQuanYi Zen Hei font for zh-tw etc,
     you can use zh-cn instead of zh.
      Please note, even if you set zh-cn, it still matches zh.
      if you don't like it, you can use compare="eq"
      instead of compare="contains".
   <test name="lang" compare="contains">
      <string>zh</string>
   </test>
   <test name="family">
      <string>serif</string>
   </test>
  <edit name="family" mode="prepend">
      <string>WenQuanYi Zen Hei</string>
   </edit>
```

</match>

## **FILES**

fonts.conf contains configuration information for the fontconfig li?
brary consisting of directories to look at for font information as well
as instructions on editing program specified font patterns before at?
tempting to match the available fonts. It is in XML format.
conf.d is the conventional name for a directory of additional configu?
ration files managed by external applications or the local administra?
tor. The filenames starting with decimal digits are sorted in lexico?
graphic order and used as additional configuration files. All of these
files are in XML format. The master fonts.conf file references this di?
rectory in an <include> directive.
fonts.dtd is a DTD that describes the format of the configuration
files.
\$XDG\_CONFIG\_HOME/fontconfig/conf.d and ~/.fonts.conf.d is the conven?

\$XDG\_CONFIG\_HOME/fontconfig/conf.d and ~/.fonts.conf.d is the conventional name for a per-user directory of (typically auto-generated) con? figuration files, although the actual location is specified in the global fonts.conf file. please note that ~/.fonts.conf.d is deprecated now. it will not be read by default in the future version.

\$XDG\_CONFIG\_HOME/fontconfig/fonts.conf and ~/.fonts.conf is the conven? tional location for per-user font configuration, although the actual location is specified in the global fonts.conf file. please note that ~/.fonts.conf is deprecated now. it will not be read by default in the future version.

\$XDG\_CACHE\_HOME/fontconfig/\*.cache-\* and ~/.fontconfig/\*.cache-\* is the conventional repository of font information that isn't found in the per-directory caches. This file is automatically maintained by fontcon? fig. please note that ~/.fontconfig/\*.cache-\* is deprecated now. it will not be read by default in the future version.

#### **ENVIRONMENT VARIABLES**

FONTCONFIG\_FILE is used to override the default configuration file.

FONTCONFIG\_PATH is used to override the default configuration direc? tory.

FONTCONFIG SYSROOT is used to set a default sysroot directory.

FC\_DEBUG is used to output the detailed debugging messages. see Debug? ging Applications section for more details.

FC\_DBG\_MATCH\_FILTER is used to filter out the patterns. this takes a comma-separated list of object names and effects only when FC\_DEBUG has MATCH2. see Debugging Applications section for more details.

FC\_LANG is used to specify the default language as the weak binding in the query. if this isn't set, the default language will be determined from current locale.

FONTCONFIG\_USE\_MMAP is used to control the use of mmap(2) for the cache files if available, this take a boolean value, fontconfig will checks if the cache files are stored on the filesystem that is safe to use mmap(2), explicitly setting this environment variable will causes skip? ping this check and enforce to use or not use mmap(2) anyway.

SOURCE\_DATE\_EPOCH is used to ensure fc-cache(1) generates files in a deterministic manner in order to support reproducible builds. When set to a numeric representation of UNIX timestamp, fontconfig will prefer this value over using the modification timestamps of the input files in order to identify which cache files require regeneration. If

SOURCE\_DATE\_EPOCH is not set (or is newer than the mtime of the direc? tory), the existing behaviour is unchanged.
